from one stage to next stages while developing a filtered model Secondly how to maintain the positional importance of data whilst purifying it Finally preservation of memory in the data is crucial to extract smart data from noisy big data If after the application of any form of smoothing or filtering the memory of the corresponding data changes heavily then the final data may lose some important information This may lead to wrong or erroneous conclusions But when anticipating any loss of information due to smoothing or filtering one cannot avoid the process of denoising as on the other hand any kind of analysis of big data in the presence of noise can be misleading So the entire process demands very careful execution with efficient and smart models in order to effectively deal with it
