Bloembergen, 1996 This selection of papers in the field of nonlinear optics contains reprints of original research and general reviews written since 1960 up to the present. Brief comments by the author place each paper in a historical context of the evolution of nonlinear optics. Papers are selected from a more comprehensive bibliography either on the basis of their influence on subsequent developments or because they were originally published in journals or conference proceedings which are less easily accessible.

The earliest papers describe his work with I.I. Rabi developing the then new magnetic resonance method and its uses to measure magnetic moments of the different forms of hydrogen and to discover the deuteron electric quadrupole moment. Later papers include his invention of the method of coherent separated oscillatory fields, the development of the atomic hydrogen maser, and the uses of these methods to measure properties of nucleons, nuclei, atoms, and molecules, and to test parity and time reversal symmetries. Other papers present the first successful theories of

nuclear magnetic shielding NMR chemical shifts electron coupled nuclear spin spin interactions and negative absolute temperatures
