### ABSTRACT

Aluminium sheet is currently used for body panels on a number of mass-produced vehicles, in particular for closure panels. AA5xxx alloys always contain coarse intermetallic particles ( $\text{Al}_3(\text{Fe,Mn})\text{Si}$ ,  $\text{Mg}_2\text{Si}$ ) after casting, undesirable for the final sheet forming and stamping operations. In the present work intermetallic particle break-up during hot reversible rolling of AA5182 alloy sheets has been analysed.

The sizes and shapes of intermetallic particles in as-cast and industrially hot rolled AA5182 alloys sheets were characterized by 3D X ray tomography observations. The relation between particle break-up and particle morphology was then analysed statistically and by a micromechanical finite element based model.

The essential outcomes of the statistical approach may be summarized as follows. The intermetallic particle population may be described by five morphological parameters (three parameters in the principal component space), allowing us to follow the evolution of inter-metallic particles during hot rolling. Secondly the comparison of the particle morphology in as cast and industrially rolled sheets leads to the definition of 5 classes. The evolution of each particle class as function of the rolling strain is provided. The statistical analysis shows *which* particles break-up.

The stresses and strains in inter-metallic particles, embedded in an elasto-viscoplastic aluminium matrix submitted to plane strain compression, were analysed by a finite element (FE) model. A new failure criterion for brittle pre-cracked solids embedded in a soft matrix submitted to large straining was proposed. The essential outcomes of the mechanical approach

*Solid Waste Management* Ramesha Chandrappa, Diganta Bhusan Das, 2012-06-30 Solid waste was already a problem long before water and air pollution issues attracted public attention Historically the problem associated with solid waste can be dated back to prehistoric days Due to the invention of new products technologies and services the quantity and quality of the waste have changed over the years Waste characteristics not only depend on income culture and geography but also on a society's economy and situations like disasters that affect that economy There was tremendous industrial activity in Europe during the industrial revolution The twentieth century is recognized as the American Century and the twenty first century is recognized as the Asian Century in which everyone wants to earn as much as possible After Asia the currently developing Africa could next take the center stage With transitions in their economies many countries have also witnessed an explosion of waste quantities Solid waste problems and approaches to tackling them vary from country to country For example while efforts are made to collect and dispose hospital waste through separate mechanisms in India it is burnt together with municipal solid waste in Sweden While trans boundary movement of waste has been addressed in numerous international agreements it still reaches developing countries in many forms While thousands of people depend on waste for their livelihood throughout the world many others face problems due to poor waste management In this context solid waste has not remained an issue to be tackled by the local urban bodies alone It has become a subject of importance for engineers as well as doctors psychologist economists and climate scientists and any others There are huge changes in waste management in different parts of the world at different times in history To address these issues an effort has been made by the authors to combine their experience and bring together a new text book on the theory and practice of the subject covering the important relevant literature at the same time
