Epitaxial Growth Part B:

Epitaxial Growth J. W. Matthews, 2013-10-22 Epitaxial Growth Part B is the second part of a collection of review articles that describe various aspects of the growth of single crystal films on single crystal substrates. The topics discussed are the nucleation of thin films, the structure of the interface between film and substrate, and the generation of defects during film growth. The methods used to prepare and examine thin films are described, and a list of the overgrowth substrate combinations studied so far is given.

Molecular Beam Epitaxy Marian A. Herman, Helmut Sitter, 2013-03-08 This first ever monograph on molecular beam epitaxy (MBE) gives a comprehensive presentation of recent developments in MBE as applied to crystallization of thin films and device structures of different semiconductor materials. MBE is a high vacuum technology characterized by relatively low growth temperature, ability to cease or initiate growth abruptly, smoothing of grown surfaces and interfaces on an atomic scale, and the unique facility for in situ analysis of the structural parameters of the growing film. The excellent exploitation parameters of such MBE produced devices as quantum well lasers, high electron mobility transistors, and superlattice avalanche photodiodes have caused this technology to be intensively developed. The main text of the book is divided into three parts. The first presents and discusses the more important problems concerning MBE equipment. The second discusses the physico-chemical aspects of the crystallization processes of different materials, mainly semiconductors and device structures. The third part describes the characterization methods which link the physical properties of the grown film or structures with the technological parameters of the crystallization procedure. Latest achievements in the field are emphasized, such as solid source MBE, including silicon MBE, gas source MBE, especially metalorganic MBE, phase locked epitaxy, and atomic layer epitaxy, photoassisted molecular layer epitaxy, and migration enhanced epitaxy.

Epitaxy Marian A. Herman, W. Richter, Helmut Sitter, 2013-03-09 Epitaxy provides readers with a comprehensive treatment of the modern models and modifications of epitaxy together with the relevant experimental and technological framework. This advanced textbook describes all important aspects of the epitaxial growth processes of solid films on crystalline substrates, including a section on heteroepitaxy. It covers and discusses in detail the most important epitaxial growth techniques which are currently widely used in basic research as well as in manufacturing processes of devices, namely solid phase epitaxy, liquid phase epitaxy, vapor phase epitaxy, including metal organic vapor phase epitaxy, and molecular beam epitaxy. Epitaxy's coverage of science and technology in thin film is intended to fill the need for a comprehensive reference and text examining the variety of problems related to the physical foundations and technical implementation of epitaxial crystallization.

Structure-Property Relationships in Surface-Modified Ceramics C.J. McHargue,R. Kossowsky,Wolfgang O. Hofer,2012-12-06 The use of ion beams for the modification of the structure and properties of the near surface region of ceramics began in earnest in the early 1980s Since the mechanical properties of such materials are dominated by surface flaws and the surface stress state the use of surface modification techniques would appear to be an obvious application As is often the case in research and development most of the initial studies can be characterized as cataloging the response of

various ceramic materials to a range of ion beam treatments The systematic study of material and ion beam parameters is well underway and we are now designing experiments to provide specific information about the processing parameter structure property relationships This NATO Advanced Study Institute was convened in order to assess our current state of knowledge in this field to identify opportunities and needs for further research and to identify the potential of such processes for technological application It became apparent that this class of inorganic compounds loosely termed ceramics presents many challenges to the understanding of ion solid interactions the relationships among ion beam parameters materials parameters and the resulting structures as well as relationships between structure and properties In many instances this understanding will represent a major extension of that learned from the study of metals and semiconductors
