Topic: Health & Medicine | Words: 2392 | Pages: 8

Introduction

Epidemiology is a scientific subject that assesses the elements and distribution of illness and injury in people groups through space and time. Epidemiologic methods refer to the various concepts applicable in finding the causes of diseases and other healthcare concerns in a community (Huremović, 2019). The epidemiologic models and systems serve a vast selection of purposes in disease examinations and healthcare research, including measuring the mortality and morbidity of a specific population, identifying the cause of a given health disorder, and examining the performance of analytic, healing, and precautionary measures (Huremović, 2019). Therefore, the prevention of infectious diseases is necessary to minimize the spread and consequences of such illnesses. This research focuses on epidemiologic concepts, theoretical frameworks, and study designs in the context of infectious diseases. It further aims to assess the epidemiology of contagious illnesses and recommend reducing virus spread and transmission.

Statement of the Problem

Infectious diseases are the primary cause of increased mortality and morbidity experienced in the current society. Their transmission is linked to human civilization, including animal domestication and urbanization. These factors led to the spread of viral infections and airborne bacteria, which are presently detrimental to human existence. Therefore, this research problem is significant since it clarifies the social context of the severity of infectious diseases, apart from assessing the probable

Epidemiologic Methods For The Study Of Infectious Diseases:

Epidemiologic Methods for the Study of Infectious Diseases James C. Thomas, David J. Weber, 2001-03-22 This is the first comprehensive text on the methodological issues in epidemiologic research on infectious diseases. It will be an invaluable resource both to students of epidemiology and to established researchers. The authors address such questions as: What needs to be considered when enrolling participants in a study of sexually transmitted diseases? What are common sources of measurement error in population based studies of respiratory infections? What are some sources of existing data for epidemiologic studies of infectious diseases? Answers to these and many other related questions can be found in this well organized comprehensive and authoritative volume, the first to thoroughly address the methodologic issues in conducting epidemiologic research on infectious diseases. The book will be an ideal complement to texts on general epidemiology and infectious disease. An introductory section will make it accessible to a wide variety of disciplines by providing an overview of topics that are foundational to understanding infectious disease epidemiology, such as the immunology of infections, the biology of infectious diseases, and concepts of causation, transmission, and dynamics. The rest of the book is structured around sections on data sources and measurement methods, by transmission type, outbreak investigation and evaluation, research, and special topics, such as HIV/AIDS research, infections in the elderly, and research collaborations in developing countries.

Epidemiologic Methods for the Study of Infectious Diseases James Conley Thomas, David Jay Weber, 2001

Infectious Disease Epidemiology Kenrad E. Nelson, Carolyn Masters Williams, 2007 Covers a range of essential topics from a survey of important historical epidemics to study designs for infectious disease investigations. The first part of the text covers ID epidemiology background and methodology, whereas the second focuses on specific diseases as examples of different transmission modalities. TB, HIV, and Influenza are among the pathogens discussed in great detail. Includes four new chapters on immunology, measles, meningococcal disease, and vector borne infections. The HIV chapter has been expanded to include issues of host genetics as well as a review of behavioral interventions. Encyclopedia of Epidemiologic Methods Mitchell H. S. Weiss, Thomas D. Koepsell, 2014-07-03 This second edition of *Epidemiologic Methods* offers a rigorous introduction to the concepts and tools of epidemiologic research. Aimed chiefly at future epidemiologists, the book offers clear descriptions, practical examples, and question answer sections for each of the science's key concepts. Authored by two award-winning epidemiology instructors, this book is ideally suited for use as a text in a graduate level course sequence in epidemiologic methods. The book's chapters are organized around three main themes: general concepts and tools of epidemiology, major study designs, and special topics including screening, outbreak investigations, and use of epidemiology to evaluate policies and programs. With additional exercises at the end of each chapter and expanded attention to topics such as confounding, this new edition of *Epidemiologic Methods* is an indispensable resource for the next generation of epidemiologic study. Advanced Epidemiology Methods for the Study of Infectious Diseases Jonathan Davitte, 2021 The COVID 19 epidemic has highlighted a number of important challenges for infectious disease Epidemiologic research: 1 scaling causal inference efforts across the human disease phenotype, 2 understanding the long term consequences of a novel disease without robust longitudinal data, and 3 leveraging non traditional data types for infectious disease research. Our dissertation provides three examples of advanced Epidemiologic methods that illustrate how researchers may address one or more of these challenges. Given the prevalence of multiple comorbidities, interrelated disease states may represent a more complete picture of COVID 19 infection severity risk compared to a disease by disease approach. We used a bias adjusted three step Latent Class Analysis (LCA) method to identify patterns of comorbidities from 31 disease indicators and measured their relationship to severe COVID 19 infection among 176,894 participants in the UK Biobank cohort. We identified 5 distinct comorbidity patterns from 31 disease indicators assessed using clinical diagnosis records from UK Biobank's comprehensive EHR data linkage between 2015-2019. Our results identified significantly increased risk for severe COVID 19 infection with substantial heterogeneity in effect sizes for each of our 4 comorbidity latent classes compared to our Healthy latent class. We investigated the associations between genetic liability to severe COVID 19 infection measured with Polygenic Risk Scores (PRS) and 31 comorbidity phenotypes derived from linked electronic health record (EHR) data in the past 20 years. PRS for very severe COVID 19 infection were associated with increased risk for uncomplicated diabetes, uncomplicated hypertension, obesity, and renal failure. Our research indicates that the same genetic composition that increases an individual's risk for COVID 19 may also influence their risk for other important comorbid diseases. Proximity to military bases may be an indicator of accessibility to military sexual partners and help identify important local HIV epidemics. We estimated the relationship between travel time to the nearest military base and HIV status among 7,514 young women recruited at local venues. Our study found that adolescent girls and young women that meet or congregate near military bases were at a slightly elevated risk for HIV infection in the combined sample, but only in 1 of our 4 military bases in stratified analysis. *Mandell, Douglas, and Bennett's Principles and Practice of Infectious Diseases* John E.
