Abstract: Epilepsy is a common condition worldwide, with approximately 50 million people suffering from it. A single seizure does not mean epilepsy; almost 10% of the population can have a seizure during their lifetime. In particular, there are many other central nervous system disorders other than epilepsy in which seizures occur, either transiently or as a comorbid condition. The impact of seizures and epilepsy is, therefore, widespread and easily underestimated. It is estimated that about 70% of patients with epilepsy could be seizure-free if correctly diagnosed and treated. However, for patients with epilepsy, quality of life is influenced not only by seizure control but also by antiepileptic drug-adverse reactions, access to education, mood, employment, and transportation.

Keywords: seizure; seizure-free; quality of life; epilepsy; education; drug-resistant; medically intractable; pharmacoresistant; surgery; neurosurgery

1. Introduction

Epilepsy is a heterogeneous disorder characterized by epileptic syndromes, diverse etiologies, and variable prognosis. Epileptic seizures are quite common, affecting between 8 and 10% of the population throughout their lifetime and accounting for 1–2% of presentations to an emergency room, and about a quarter of these will be first seizure with a different type (Table 1) [1,2].

Neuropsychology of Childhood Epilepsy Isabelle Jambaqué, Maryse Lassonde, Olivier Dulac, 2006-04-11 This book is devoted to the neuropsychological description of childhood epilepsy a neurological condition that constitutes one of the most prevalent forms of chronic and disabling childhood illnesses Indeed one child out of 20 experiences one or more seizures before the age of 5 and one in a hundred develops epilepsy as a chronic disorder Approximately half of these children with epilepsy display academic difficulties and or behavioral disorders Moreover it is now believed that a sizable proportion of children with learning disability suffer from undiagnosed epilepsy While a great number of textbooks have been devoted to various medical aspects of childhood epilepsy diagnosis genetics etiology drug and surgical treatment etc there have been no comprehensive accounts of the cognitive consequences of this condition Advance of medical knowledge has shown that childhood epilepsy should not be considered as a single disorder but encompasses a whole range of different conditions that exhibit specific clinical EEG and outcome characteristics It is not becoming apparent that these various clinical entities have different cognitive expression that yet need to be specified The purpose of this book is to provide a complete up to date analysis of this multifaceted pathology
