Hoffman,Gareth E. Conway,Jan Maarten Schraagen,David Peebles,Robert J. B. Hutton,Erich J. Petushek,2018-02-28 The increasing complexity of work systems and changes in the nature of workplace technology over the past century have resulted in an exponential shift in the nature of work activities from physical labor to cognitive work Modern work systems have many characteristics that make them cognitively complex They can be highly interactive comprised of multiple agents and artifacts information may be limited and distributed across space and time task goals are frequently ill defined conflicting dynamic and emergent planning may only be possible at general levels of abstraction or require adaptive solutions some degree of proficiency or expertise is required

the stakes are often high and uncertainty time constraints and stress are seldom absent To complicate matters further cognition in complex work settings is typically constrained by broader professional organizational and institutional practice and policy These features of cognitive work present significant challenges to scientific methodology and theory and subsequent design of reliable interventions Historically philosophers and scientists have attempted to understand the mental activities experienced during cognitive work at multiple levels of analysis using divergent methods Some have examined cognition at an associative contextual functional or holistic level relying on naturalistic methods to understand the higher mental processes as they work in harmony during goal directed behavior Others have embraced experimental methods and favored internal over external validity often reducing cognition to a psychology of fundamental acts such as short term memory access with millisecond shifts in attention More recently Macrocognition has evolved as a complementary paradigm Macrocognitive researchers have studied the cognitive functions and processes associated with skilled adaptive collaborative and resilient cognitive work in the context of the aforementioned complexities of psychotechnical and sociotechnical work systems Typically this research has been carried out using cognitive task analytic techniques that draw on both naturalistic and quasi experimental methods The primary goals of research in Macrocognition are to better understand cognitive adaptations to complexity to increase our theoretical understanding of the organism environment relations by studying the mapping between cognitive work and real world demands and to promote use inspired research capable of improving system performance

Integrating Human Factors Methods and Systems Thinking for Transport Analysis and Design Gemma J. M. Read, Vanessa Beanland, Michael G. Lenné, Neville A. Stanton, Paul M. Salmon, 2017-07-26 Governments and road safety agencies around the world have either introduced or are considering safe system strategies a long overdue acknowledgement that different elements of the road system contribute to road safety outcomes Human factors approaches have a leading role here in both conceptualising the road system as a complex sociotechnical system and in providing practical approaches to support true systems based countermeasures This book illustrates the potential for integrating contemporary systems based human factors methods with modern day driving assessment methods such as vehicle instrumentation and driving simulation to understand and enhance performance in

modern day road transport systems The book outlines why a fundamental paradigm shift is needed in the way these systems are designed and operated and illustrates how a wide range of accepted human factors approaches can be applied successfully to road transport to revolutionise the countermeasure design process The practical illustrations of these human factors methods are applied to a long standing road and rail safety issue rail level crossings where the road and rail systems intersect The final chapter of the book highlights the utility of the human factors approach to reducing road trauma and discusses future applications of the approach Handbook of Research on Ergonomics and Product Design Hernández Arellano, Juan Luis, Maldonado Macías, Aide Aracely, Castillo Martínez, Juan Alberto, Peinado Coronado, Porfirio, 2018-04-06 Product design is an important field where ergonomics and human factors should be applied To achieve this goal effective strategies for process improvement must be researched and implemented The Handbook of Research on Ergonomics and Product Design is a critical scholarly resource that provides new theories methodologies and applications of ergonomics and product design and redesign Featuring a broad range of topics such as additive manufacturing product analysis and sustainable packing development this book is geared towards academicians practitioners and researchers seeking current research on new theories methods and applications related to ergonomics and product design Prospective Ergonomics André Liem, 2017-10-30 This book argues for a prospective turn in ergonomics to challenge the established fields of strategic design SD and management Its multi disciplinary outlook builds upon concepts derived from Management Innovation and Design Science Differences similarities and relationships between strategic design and prospective ergonomics are reviewed using existing theories and frameworks from design ergonomics and strategic and innovation management To complement the theory 12 cases have been analyzed in greater depth according to 4 main dimensions of analysis Outcomes have shown that innovating through the Prospective Ergonomics PE approach is about finding the right balance between on the one hand meeting primary objectives such as profit maximization or solving the design problem and on the other acknowledging that human activity is bounded by rationality This means that humans have diverse motives *Fundamentals and Assessment Tools for Occupational Ergonomics* William S. urban infrastructures and how to shape urban spaces including stadiums and museums It covers warning systems in cars voice based interfaces and the positive effects on manufacturing processes available from health informatics and management systems Several chapters examine the role human factors can play in counter terrorism efforts and in interpreting deceptive behaviors They provide suggestions on how to improve enterprise resource planning systems and stress the importance of lifelong learning personalized learning and work life balance The book also highlights issues with special populations detailing how to design and adapt products and work situations for these groups In addition to exploring the challenges faced in optimizing sociotechnical systems the book underlines themes that play a role in all the challenges and how they are linked to each other It concludes with an exploration of emotional ergonomics and the important positive effects of making people happy and healthy With authors from around the globe the book supplies a broad look at current challenges and possible solutions

Intelligent Infrastructure Nastaran Dadashi,David Golightly,Sarah Sharples,Richard Bye,2023-07-30 With the

development of sensor technology wireless communications big data and machine learning there is an increasing interest in technologies and solutions that assess and predict the state of equipment and assets within various industrial settings These technologies aim to collect information from multiple sources about infrastructure asset status Then through current and historical data analysis this configuration of technologies delivers intelligence on current and future asset status to a maintenance operator or manager to inform optimal maintenance decision making These technologies are known under different terms remote condition monitoring e maintenance prognostic systems predictive maintenance and smart or

intelligent infrastructure Despite the promise of remote condition monitoring and predictive technologies there is a growing concern with such technologies because they can be difficult or impractical to use Understanding and mitigating potential human factors issues could ensure that such vast investments are not wasted This book considers in depth the challenges placed on users of current and future condition monitoring systems Its primary focus is to understand the cognitive processes including managing alarms interpreting data and collaborating with automation The book describes a range of human factors methods that can be used to understand the current and future functioning of people and technology in an enhanced maintenance and asset monitoring context The book also presents a framework for describing these issues systematically and presents the resulting design considerations to increase the effectiveness of individual operators and organisations as a whole
