Ergonomics Of Computer Pointing Devices:

The Ergonomics of Computer Pointing Devices Sarah A. Douglas, Anant Kartik Mithal, 2012-12-06 We first began looking at pointing devices and human performance in 1990 when the senior author Sarah Douglas was asked to evaluate the human performance of a rather novel device a finger controlled isometric joystick placed under a key on the keyboard Since 1990 we have been involved in the development and evaluation of other isometric joysticks a foot controlled mouse a trackball and a wearable computer with head mounted display We unabashedly believe that design and evaluation of pointing devices should evolve from a broad spectrum of values which place the human being at the center These values include performance issues such as pointing time and errors physical issues such as comfort and health and contextual issues such as task usability and user acceptance This book chronicles this six year history of our relationship as teacher Douglas and student Mithal as we moved from more traditional evaluation using Fitts law as the paradigm to understanding the basic research literature on psychomotor behavior During that process we became profoundly aware that many designers of pointing devices fail to understand the constraints of human performance and often do not even consider experimental evaluation critical to usability decisions before marketing a device We also became aware of the fact that contrary to popular belief in the human computer interaction community the problem of predicting pointing device performance has not been solved by Fitts law Similarly our expectations were biased by the cognitive revolution of the past 15 years with the belief pointing device research was low level and uninteresting
