Research Report - Corps of Engineers, U.S. Army, Cold Regions Research and Engineering Laboratory, 1963

Effective Thermal Conductivity of Snow at -88°C, and -5°C D. Pitman, B. Zuckerman, 1968 The thermal conductivity of vapor grown pseudodendritic snow crystals has been measured at 88 C 27 C and 5 C over a density range of 0.1 to 0.6 g cc⁻¹ in a steady state apparatus **NOAA Technical Report NWS**, 1971 *Principles of Snow Hydrology* David R. DeWalle, Albert Rango, 2008-07-03 Principles of Snow Hydrology describes the factors that control the accumulation melting and runoff of water from seasonal snowpacks over the surface of the earth The book addresses not only the basic principles governing snow in the hydrologic cycle but also the latest applications of remote sensing and techniques for modeling streamflow from snowmelt across large mixed land use river basins Individual chapters are devoted to climatology and distribution of snow snowpack energy exchange snow chemistry ground based measurements and remote sensing of snowpack characteristics snowpack management and modeling snowmelt runoff Many chapters have review questions and problems with solutions available online This book is a reference book for practicing water resources managers and a text for advanced hydrology and water resources courses which span fields such as engineering earth sciences meteorology biogeochemistry forestry and range management and water resources planning *NOAA Technical Report NWS*. United States. National Weather Service, 1971 **Effective Thermal Conductivity of Ventilated Snow** Yin-Chao Yen, 1963

Thermal conductivities of unconsolidated snow particles with air flowing in a direction parallel but opposite to the energy flow have been investigated for the mass flow rate ranging approximately from 10 to 40 times 10 to the 4 g sq cmsec based on the total cross sectional area of the flask containing the snow sample The results are interpreted as being the effective thermal conductivity of snow In the experimental range for snow densities from 0.376 to 0.472 g cu cm and corresponding snow particle sizes of 0.07 to 0.22 cm nominal diameter the results can be represented well by the following leastsquares equation $k_{\text{eff}} = 0.0014 + 0.58 G$ where k_{eff} is the effective thermal conductivity of snow in cal cm sec C and G is the mass flow rate of dry air in g cu cm sec When there is no flow or G = 0 k_{eff} reduces to a constant value of 0.0014 cal cm sec C equivalent to the thermal conductivity of snow with motionless fluid The value of 0.0014 is in good agreement with the data reported by Abel s 1893 and Kondrat eva 1945 Author *Storm Tide Frequencies on the South Carolina Coast* Vance A. Myers, 1975 A Point Energy and Mass Balance Model of a Snow Cover Eric A. Anderson, 1976 **Technical Abstract Bulletin**, 1965 *Scaling Analysis in Modeling Transport and Reaction Processes* William B. Krantz, 2007-06-30 This book is

unique as the first effort to expound on the subject of systematic scaling analysis Not written for a specific discipline the book targets any reader interested in transport phenomena and reaction processes The book is logically divided into chapters on the use of systematic scaling analysis in fluid dynamics heat transfer mass transfer and reaction processes An integrating chapter is included that considers more complex problems involving combined transport phenomena Each chapter includes several problems that are explained in considerable detail These are followed by several worked examples for which the general outline for the scaling is given Each chapter also includes many practice problems This book is based on recognizing the value of systematic scaling analysis as a pedagogical method for teaching transport and reaction processes and as a research tool for developing and solving models and in designing experiments Thus the book can serve as both a textbook and a reference book

Advances in Hydrosience Ven Te Chow, 2013-10-22 Advances in Hydrosience Volume 5 contains articles in three major areas of hydrosience namely stochastic hydrology subsurface flow and solid state hydrology This volume is composed of four chapters and begins with a comprehensive review of the basic concepts developments and their potential application in stochastic hydrology with emphasis on time series analysis and synthesis model building The next chapter deals with some of the advances in various scientific disciplines and their application to the analysis and prediction of seepage losses from open channels These topics are followed by discussions on various phenomena of snow metamorphism sintering and development of intergranular bonds a few methods for determining thermal conductivity water vapor diffusivity and the essential concepts of radiation interaction with a snow medium The final chapter surveys the theory of infiltration which is one important outcome of the mathematical physical approach to the study of water movement in unsaturated soil This chapter specifically presents the general flow equation a nonlinear Fokker Planck equation This book is of great value to hydrologists engineers scientists and researchers who are interested in the interdisciplinary field of hydrosience
