The Physiology of Exercise in Spinal Cord Injury J. Andrew Taylor, 2016-12-20 Every year around the world between 250 000 and 500 000 people suffer a spinal cord injury SCI Those with an SCI are two to five times more likely to die prematurely than people without a spinal cord injury with worse survival rates in low and middle income countries Dynamic aerobic requires integrated physiologic responses across the musculoskeletal cardiovascular autonomic pulmonary thermoregulatory and immunologic systems Moreover regular aerobic exercise beneficially impacts these same systems reducing the risk for a range of diseases and maladies This book will present comprehensive information on the unique physiologic effects of SCI and the potential role of exercise in treating and mitigating these effects In addition it will incorporate work from scientists across a number of disciplines and have contributors at multiple levels of investigation and across physiologic systems Furthermore SCI can be considered an accelerated form of aging due to the severely restricted physical inactivity imposed usually at an early age Therefore the information presented may have a broader importance to the physiology of aging as it relates to inactivity Lastly the need for certain levels of regular aerobic exercise to engender adaptations beneficial to health is not altered by the burden of an SCI Indeed the amounts of exercise necessary may be even greater than the able bodied due to passive ambulation This book will also address the potential health benefits for those with an SCI that can be realized if a sufficient

Dimitrijevic, 2012-01-12 Following injury or disease neural circuitry can be altered to varying degrees leading to highly individualized characteristics that may or may not resemble original function In addition lost or partially damaged circuits and the effects of biological recovery processes coupled with learned compensatory strategies create a new neuroanatomy with capabilities that are often not functional or may interfere with daily life To date the majority of approaches used to treat neurological dysfunction have focused on the replacement of lost or damaged function usually through the suppression of surviving neural activity and the application of mechanical assistive devices Restorative Neurology of Spinal Cord Injury offers a different and novel approach Focusing on the spinal cord and its role in motor control the book details the clinical and neurophysiological assessment process and methods developed throughout the past half century by basic and clinical scientists Then through the use of specialized clinical and neurophysiological testing methods conduction and processing performed within the surviving neural circuitry is examined and characterized in detail Based on the results of such assessment treatment strategies also described in this book are applied to augment rather than replace the performance of surviving neural circuitry and improve the functional capacity of people who have experienced injury to their spinal cords **Spinal Cord Injury Rehabilitation** Edelle Field-Fote, 2009-03-26 One of the world s leading authorities in spinal cord injury and a participant in the Human Brain Project brings you an evidenced based guide to the state of the art in spinal cord rehabilitation She has assembled an expert team of clinicians each with expertise in the content areas they address Their work encompasses all of the new scientific knowledge and technological advances practitioners need to know to determine the most effective rehabilitation interventions for each patient and to attain maximum restoration of function in individuals with SCI **Handbook of**

Adaptability of Human Gait A.E. Patla, 1991-03-25 A large number of volumes have been produced summarizing the work on generation and control of rhythmic movements in particular locomotion. Unfortunately, most of them focus on locomotor studies done on animals. This edited volume redresses that imbalance by focusing completely on human locomotor behaviour. The very nature of the problem has both necessitated and attracted researchers from a wide variety of disciplines ranging from psychology, neurophysiology, kinesiology, engineering, medicine, to computer science. The different and unique perspectives they bring to this problem provide a comprehensive picture of the current state of knowledge on the generation and regulation of human locomotor behaviour. A common unifying theme of this volume is studying the adaptability of human gait to obtain insights into the control of locomotion. The intentional focus on adaptability is meant to draw attention to the importance of understanding the generation and regulation of skilled locomotor behaviour rather than just the generation of basic locomotor patterns which has been the major focus of animal studies. The synthesis chapter at the end of the volume examines how the questions posed, the technology, and the experimental and theoretical paradigms have evolved over the years and what the future has in store for this important research domain.
