Fundamental Symmetries And Nuclear Structure:

Fundamental Symmetries and Nuclear Structure J. N. Ginocchio, S. P. Rosen, 1989 **Nuclear Physics** National Research Council, Division on Engineering and Physical Sciences, Board on Physics and Astronomy, Committee on Nuclear Physics, 1999-03-31 Dramatic progress has been made in all branches of physics since the National Research Council's 1986 decadal survey of the field. The Physics in a New Era series explores these advances and looks ahead to future goals. The series includes assessments of the major subfields and reports on several smaller subfields and preparation has begun on an overview volume on the unity of physics, its relationships to other fields, and its contributions to national needs. Nuclear Physics is the latest volume of the series. The book describes current activity in understanding nuclear structure and symmetries, the behavior of matter at extreme densities, the role of nuclear physics in astrophysics and cosmology, and the instrumentation and facilities used by the field. It makes recommendations on the resources needed for experimental and theoretical advances in the coming decade.

Rare Isotopes And Fundamental Symmetries - Proceedings Of The Fourth Argonne/int/msu/jina Frib Theory Workshop B. Alex Brown, Jonathan Engel, Wick C Haxton, Michael Ramsey-musolf, Michael Romalis, Guy Savard, 2009-01-05 This book presents contributions from the Workshop on Rare Isotopes and Fundamental Symmetries which was held on September 19-22, 2007 at the Institute for Nuclear Theory at the University of Washington. The book is the fourth in a series dedicated to exploring the science important to the proposed Facility for Rare Isotope Beams (FRIB). The topics covered by the contributions include Fermi beta decay, electron neutrino correlations in nuclear beta decay, precision mass measurements, atomic parity violation, electric dipole moments, and hadronic parity violation and anapole moments. These topics highlight the recent work on the use of nuclei to understand the fundamental symmetries of nature. It presents current results as well as proposals for future experiments.

Symmetries in Intermediate and High Energy Physics A. Faessler, T.S. Kosmas, G.K. Leontaris, 2000-03-15 This book contains comprehensive reviews of modern topics in nuclear physics, particle physics, astrophysics, and cosmology. Special emphasis is placed on the role of several symmetries in physics at intermediate and high energies and on neutrino physics with its implications in nuclear astrophysics and cosmology. Many applications of the theories and experiments are included along with interesting information on recent developments with respect to current problems in modern physics. Thus it will be especially useful to new scientists and graduate students.

Ab Initio Approaches to Nuclear Structure, Scattering and Tests of Fundamental Symmetries Michael Gennari, 2021 In recent decades the accessibility of nuclear physics has been greatly improved due to the advent of modern supercomputers as well as theoretical developments in effective field theory and ab initio first principles nuclear approaches. As a result in modern nuclear theory it is possible to perform realistic quantum many body calculations of nuclear systems beginning solely from underlying Standard Model symmetries. A fundamental object of interest in nuclear structure are the nuclear densities which may be abundantly used in calculation of other nuclear observables. Utilizing the ab initio no core

shell model a rigorous theoretical approach for calculations involving light nuclei we study the coordinate space densities of various nuclear systems and discuss the importance of nonlocality and translation invariance in the densities In particular this property is investigated at length in the context of scattering theory in which optical potentials are constructed from the ab initio no core shell model densities We explore the impacts of nonlocality and translation invariance in proton and antiproton scattering and in the latter we review the first fully microscopic optical potential for antiproton nucleus scattering In addition while the full problem is intractable at present we assess the potential impact of many nucleon dynamics on scattering observables We additionally present an analytic computation of the nuclear kinetic density distribution derived from the nonlocal nuclear densities While the nuclear problem has become increasingly tractable the computational barrier is still ever present with nuclear calculations pushing the frontier of modern supercomputing Many approaches have been developed to quell the computational demand e g the similarity renormalization group approach We introduce and discuss another approach namely the natural orbitals unitary transformation which has been shown increase the convergence rate of quantum many body calculations Lastly in the past three years there has revitalized interest in reevaluation of particular Standard Model symmetries Notably the Cabibbo Kobayashi Maskawa quark mixing matrix has been established as a high precision test of the Standard Model capable of pointing to novel physics Recent theoretical advances in corrections needed to evaluate unitarity of the Cabibbo Kobayashi Maskawa matrix have indicated a statistical discrepancy with the Standard Model expectation In light of this development using the ab initio no core shell model with continuum we pursue a high precision calculation of the isospin symmetry breaking correction δ_C This correction is one of two nuclear structure dependent corrections needed to shed light on this discrepancy and potentially identify physics beyond the Standard Model
