RENEWABLE ENERGY

We use many machines like television, fan and car. These machines require **electricity** to work. But where does all this electricity come from? Electricity is generated from lots of different sources. These sources can be divided into two types: **Renewable** and **Non-renewable**.

Non-renewable sources of energy cannot be replaced, once they are used up. Coal, oil and natural gas are non-renewable sources. These are known as **fossil fuels** and take millions of years to form. We are using them faster than nature makes them. They aren't sustainable. That means we won't be able to use these energy sources forever because we will eventually exhaust them.

Renewable energy sources like sun, wind and flowing water will never finish up. Wind will never stop blowing, water will never stop flowing and Sun will be there for very long time (about 5 billion years). Sunlight can be used to generate electricity using solar panels. Wind and moving water can turn turbines to produce electricity. They provide us with clean energy. Means they do not pollute the environment. These energy sources are **sustainable** because we can use them forever without running out.

Every energy source has some downsides. Fossil fuels are burnt to generate electricity but it causes **air pollution**. Sunlight is not available on a cloudy day or at night. To generate electricity from wind we require large wind farms, that take up a lot of land. For hydro energy we need to build dams. Dams stop water flow in rivers causing harm to animals and plants living in rivers.

It's important to understand how electricity is generated and what effect it has on our environment. We need to work on new technology that provides us with clean and sustainable energy, which we can use on Earth
