Peter Drexler, president of the Max Planck Physics Institute as a successor of Heisenberg explains the mechanism of a living Earth sustained by accumulated energy resources provided by the sun. He clarifies a point on preserving the dynamic stability of minerals and life on Earth. Shohei Yonemoto, a well-known political scientist focusing on sustainability, explains environmental politics and why the IPCC and UNFCCC framework were established based on precaution principles. He puts forward a new concept called futurology which considers population and food problems from a Malthusian standpoint and incorporates them into issues such as climate change and natural disasters. This book is written and based on a very simple but concrete idea and provides the readers with a chance to consider the shape of future Earth. Climate Change 2022 – Impacts, Adaptation and Vulnerability Intergovernmental Panel on Climate Change (IPCC), 2023-06-22. The Working Group II contribution to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. IPCC provides a comprehensive assessment of the scientific literature relevant to climate change impacts, adaptation, and vulnerability. The report recognizes the interactions of climate, ecosystems, and biodiversity, and human societies, and integrates across the natural, ecological, social, and economic sciences. It emphasizes how efforts in adaptation and in reducing greenhouse gas emissions can come together in a process called climate resilient development which enables a liveable future for biodiversity and humankind. The IPCC is the leading body for assessing climate change science. IPCC reports are produced in comprehensive, objective, and transparent ways ensuring they reflect the full range of views in the scientific literature. Novel elements include focused topical assessments and an atlas presenting observed climate change impacts and future risks from global to regional scales. Available as Open Access on Cambridge Core. *Environmental Studies and Climate Change* R. C. Sobti, Sandeep K. Malhotra, Kamal Jaiswal, Sanjeev Puri, 2022-12-13. Currently, anthropogenic activities have caused unprecedented destruction of the environment at alarming rates, leading to undesirable alterations in air, land, and water. The process of environment degradation has been accelerated by industrial processes which result in waste as well as over consumption of natural resources. The ecological balance has been disturbed and resources have shrunk. All this has resulted in climate change which has emerged as a major concern in the 21st century. Changes in the environment are driven by demand for energy, water, and food to raise the standard of living. These are also responsible for climate change with contributions from deforestation and CO₂ emissions from fossil fuels such as coal and petroleum. The present volume discusses some of the main issues regarding environmental degradation and the causes as well as the impact of climate change which is impacting the ecosystem. The effects of various pollutants, causes of climate change, with case studies on geochemistry and glaciers etc. and measures to reduce the impact on biodiversity, health etc. are discussed in detail in its chapters. In a nutshell, this volume discusses in detail the following issues: Anthropogenic and natural factors in environmental degradation; Climate change history; causes and threats to abiotic and biotic systems; Case studies on the impact of climate change and living systems; Mitigation and preparedness for the future. Climate Impacts on Energy Systems Jane O. Ebinger, 2011 While the energy sector is a primary target of efforts to arrest and reverse the growth of greenhouse gas emissions and lower the carbon footprint of development it is also expected to be increasingly affected by unavoidable climate consequences from the damage already induced in the biosphere Energy services and resources as well as seasonal demand will be increasingly affected by changing trends increasing variability greater extremes and large inter annual variations in climate parameters in some regions All evidence suggests that adaptation is not an optional add on but an essential reckoning on par with other business risks Existing energy infrastructure new infrastructure and future planning need to consider emerging climate conditions and impacts on design construction operation and maintenance Integrated risk based planning processes will be critical to address the climate change impacts and harmonize actions within and across sectors Also awareness knowledge and capacity impede mainstreaming of climate adaptation into the energy sector However the formal knowledge base is still nascent information needs are complex and to a certain extent regionally and sector specific This report provides an up to date compendium of what is known about weather variability and projected climate trends and their impacts on energy service provision and demand It discusses emerging practices and tools for managing these impacts and integrating climate considerations into planning processes and operational practices in an environment of uncertainty It focuses on energy sector adaptation rather than mitigation which is not discussed in this report This report draws largely on available scientific and peer reviewed literature in the public domain and takes the perspective of the developing world to the extent possible
