A Gentle Introduction to Effective Computing in Quantitative Research Harry J. Paarsch, Konstantin Golyaev, 2016-05-06 A practical guide to using modern software effectively in quantitative research in the social and natural sciences This book offers a practical guide to the computational methods at the heart of most modern quantitative research It will be essential reading for research assistants needing hands on experience students entering PhD programs in business economics and other social or natural sciences and those seeking quantitative jobs in industry No background in computer science is assumed a learner need only have a computer with access to the Internet Using the example as its principal pedagogical device the book offers tried and true prototypes that illustrate many important computational tasks required in quantitative research The best way to use the book is to read it at the computer keyboard and learn by doing The book begins by introducing basic skills how to use the operating system how to organize data and how to complete simple programming tasks For its demonstrations the book uses a UNIX based operating system and a set of free software tools the scripting language Python for programming tasks the database management system SQLite and the freely available R for statistical computing and graphics The book goes on to describe particular tasks analyzing data implementing commonly used numerical and simulation methods and creating extensions to Python to reduce cycle time Finally the book describes the use of LaTeX a document markup language and preparation system An Introduction to High-performance Scientific Computing , 1996 Designed for undergraduates An Introduction to High Performance Scientific Computing assumes a basic knowledge of numerical computation and proficiency in Fortran or C programming and can be used in any science computer science applied mathematics or engineering department or by practicing scientists and engineers especially those associated with one of the national laboratories or supercomputer centers This text evolved from a new curriculum in scientific computing that was developed to teach undergraduate science and engineering majors how to use high performance computing systems supercomputers in scientific and engineering applications Designed for undergraduates An Introduction to High Performance Scientific Computing assumes a basic knowledge of numerical computation and proficiency in Fortran or C programming and can be used in any science computer science applied mathematics or engineering department or by practicing scientists and engineers especially those associated with one of the national laboratories or supercomputer

centers The authors begin with a survey of scientific computing and then provide a review of background numerical analysis IEEE arithmetic Unix Fortran and tools elements of MATLAB IDL AVS Next full coverage is given to scientific visualization and to the architectures scientific workstations and vector and parallel supercomputers and performance evaluation needed to solve large scale problems The concluding section on applications includes three problems molecular dynamics advection and computerized tomography that illustrate the challenge of solving problems on a variety of computer architectures as well as the suitability of a particular architecture to solving a particular problem Finally since this can only be a hands on course with extensive programming and experimentation with a variety of architectures and programming paradigms the authors have provided a laboratory manual and supporting software via anonymous ftp Scientific and Engineering Computation series

Computer-aided Molecular Design William Graham Richards,1989 *The Efficient Use of Vector Computers with Emphasis on Computational Fluid Dynamics* Willi Schönauer,Wolfgang Gentzsch,2013-11-11 The GAMM Committee for Numerical Methods in Fluid Mechanics organizes workshops which should bring together experts of a narrow field of computational fluid dynamics CFD to exchange ideas and experiences in order to speed up the development in this field In this sense it was suggested that a workshop should treat the solution of CFD problems on vector computers Thus we organized a workshop with the title The efficient use of vector computers with emphasis on computational fluid dynamics The workshop took place at the Computing Centre of the University of Karlsruhe March 13 15 1985 The participation had been restricted to 22 people of 7 countries 18 papers have been presented In the announcement of the workshop we wrote Fluid mechanics has actively stimulated the development of superfast vector computers like the CRAY s or CYBER 205 Now these computers on their turn stimulate the development of new algorithms which result in a high degree of vectorization scalar vectorized execution time But with 3 D problems we quickly reach the limit of present vector computers If we want e g to solve a system of 6 partial differential equations e g for u v w p k or for the vectors u $\text{curl } u$ on a $50 \times 50 \times 50$ grid we have 750 000 unknowns and for a 4th order difference method we have circa 60 million nonzero coefficients in the highly sparse matrix This characterizes the type of problems which we want to discuss in the workshop
