Effects Of Explosions On Materials:

Effects of Explosions on Materials Stepan S. Batsanov,2013-06-29 In the 1950s explosives began to be used to generate ultrahigh pressures in condensed substances in order to modify their properties and structure Notwithstanding the short duration of an explosion its energy proved to be high enough to perform physical chemical transformations of substances and the new method gained wide industrial applications It has both advantages and drawbacks in comparison with the traditional method of static compression The latter method notorious for its cumbersome and expensive machinery allows one to maintain high pressure as long as one pleases and to regulate the temperature of the sample arbitrarily But the pressure available is rather limited and for any increase of this limit one has to pay by the progressive shrinking of the working volume of a press The dynamic method has the advantages of low cost and practically no restrictions of magnitude of pressure and the size of a processed sample but the temperature in a compressed body is no longer controlled by an experimenter Rather it is firmly dictated by the level of loading according to the equation of state Hence it is difficult to recover metastable products and impossible to prepare solids with a low concentration of defects as the duration of explosion is too short for their elimination Effects of Explosions on Materials Stepan S.
