Exact Exponential Algorithms Fedor V. Fomin, Dieter Kratsch, 2010-10-26 For a long time computer scientists have distinguished between fast and slow algorithms Fast or good algorithms are the algorithms that run in polynomial time which means that the number of steps required for the algorithm to solve a problem is bounded by some polynomial in the length of the input All other algorithms are slow or bad The running time of slow algorithms is usually exponential This book is about bad algorithms There are several reasons why we are interested in exponential time algorithms Most of us believe that there are many natural problems which cannot be solved by polynomial time algorithms The most famous and oldest family of hard problems is the family of NP complete problems Most likely there are no polynomial time algorithms solving these hard problems and in the worst case scenario the exponential running time is unavoidable Every combinatorial problem is solvable in finite time by enumerating all possible solutions i.e. by brute force search But is brute force search always unavoidable? Definitely not Already in the nineteen sixties and seventies it was known that some NP complete problems can be solved significantly faster than by brute force search Three classic

examples are the following algorithms for the TRAVELLING SALESMAN problem MAXIMUM INDEPENDENT SET and COLORING

Graph Drawing Joe Marks, 2003-07-31 This year's meeting marked the Eighth International Symposium on Graph Drawing The organizing and program committees worked hard to make this year's symposium possible and we were delighted that so many people came to Lional Williamsburg Virginia for three days of the latest results in the field of graph drawing As in previous years the review process was quite competitive We accepted 30 out of 53 regular length submissions and 5 out of 15 short submissions for a total acceptance ratio of 35 out of 68 or 51% This year's program featured several new developments in the field Four different approaches for handling very large graphs were presented in a session on force directed layout Two sessions were devoted to the latest advances in orthogonal graph drawing And alongside the usual mix of theory and practice papers we had several contributions based on empirical studies of users and of

systems Our invited talks were given by two speakers who were new to most members of the GD community but who work in areas that are closely related to graph drawing Professor Colin Ware of the University of New Hampshire told us how knowledge of human visual perception is useful for the design of effective data visualizations And Professor David Jensen of the University of Massachusetts at Amherst talked about the process of knowledge discovery from graphs a process that involves more than just graph drawing and visualization

Drawing Graphs Michael Kaufmann,Dorothea Wagner,2003-06-29 Graph drawing comprises all aspects of visualizing structural relations between objects The range of topics dealt with extends from graph theory graph algorithms geometry and topology to visual languages visual perception and information visualization and to computer human interaction and graphics design This monograph gives a systematic overview of graph drawing and introduces the reader gently to the state of the art in the area The presentation concentrates on algorithmic aspects with an emphasis on interesting visualization problems with elegant solutions Much attention is paid to a uniform style of writing and presentation consistent terminology and complementary coverage of the relevant issues throughout the 10 chapters This tutorial is ideally suited as an introduction for newcomers to graph drawing Ambitioned practitioners and researchers active in the area will find it a valuable source of reference and information

Graph-Theoretic Concepts in Computer Science Dieter Kratsch,2005-12-06 This book constitutes the thoroughly refereed post proceedings of the 31st International Workshop on Graph Theoretic Concepts in Computer Science WG 2005 held in Metz France in June 2005 The 38 revised full

papers presented together with 2 invited papers were carefully selected from 125 submissions. The papers provide a wealth of new results for various classes of graphs: graph computations, graph algorithms, and graph theoretical applications in various fields. The workshop aims at uniting theory and practice by demonstrating how graph theoretic concepts can be applied to various areas in Computer Science or by extracting new problems from applications. The goal is to present recent research results and to identify and explore directions of future research.
