Beus, 1987 U.S. Geological Survey Professional Paper, 1984 **Proceedings of the Sixth International Graptolite Conference of the GWG (IPA) and the SW Iberia Field Meeting 1998 of the International Subcommission on Silurian Stratigraphy (ICS-IUGS)** J. Walliser, 2012-12-06 The existence of rapid and even catastrophic turnovers within the Phanerozoic ecosystems has been discussed controversially for more than 170 years Since 1980 this discussion has become even more intensive after the hypothesis of Alvarez explaining the end Cretaceous mass extinction as the result of a huge asteroid impact on the Earth This theory stimulated several thousand papers and is still controversial The international research programme on Global Biological Events in Earth History attempts to bring the discussion back to the facts by using multidisciplinary investigations of the major Phanerozoic events The results of an international group of experts are presented giving a wealth of information and a thorough discussion of the causes of the various global events Graptolite Paleobiology Jörg Maletz, 2017-03-14 The graptolites constitute one of the geologically most useful taxonomic groups of fossils for dating rock successions understanding paleobiogeography and reconstructing plate tectonic configurations in the Lower Palaeozoic Graptolites were largely planktic marine organisms and as one of the first groups that explored the expanses of the world's oceans are vital for understanding Palaeozoic ecology They are the best and often the only fossil group for dating Lower Palaeozoic rock successions precisely Thousands of taxa have been described from all over the planet and are used for a wide variety of geological and palaeontological biological research topics The recent recognition of the modern pterobranch Rhabdopleura as a living benthic graptolite enables a much better understanding and interpretation of the fossil Graptolithina In the decades since the latest edition of the Graptolite Treatise the enormous increase of knowledge on this group of organisms has never been synthesised in a compelling and coherent way and information is scattered in scientific publications and difficult to sort through This volume provides an up to date insight into research on graptolites Such research has advanced considerably with the use of new methods of investigation and documentation SEM investigation and research on ultrastructure of the tubaria has made it possible to compare extant and extinct taxa in much more detail Cladistic interpretation of graptolite taxonomy and evolution has advanced the understanding of this group of organisms considerably in the last two decades and has highlighted their importance in our understanding of evolutionary processes This book will show graptolites including their modern living relatives in a quite new and fascinating light and will

demonstrate the impact that the group has had on the evolution of the modern marine ecosystem This book is aimed not only at earth scientists but also at biologists ecologists and oceanographers It is a readable and comprehensible volume for students at the MSc level while remaining accessible to undergraduates and non specialists seeking up to date information about this fascinating topic in palaeobiology      **Palaeoecology and Biostratigraphy of Graptolites** International Palaeontological Association.
