*Graph-theoretic Techniques For Web Content Mining* Adam Schenker, Horst Bunke, Mark Last, Abraham

Kandel, 2005-05-31 This book describes exciting new opportunities for utilizing robust graph representations of data with common machine learning algorithms. Graphs can model additional information which is often not present in commonly used data representations such as vectors. Through the use of graph distance a relatively new approach for determining graph similarity the authors show how well known algorithms such as k means clustering and k nearest neighbors classification can be easily extended to work with graphs instead of vectors. This allows for the utilization of additional information found in graph representations while at the same time employing well known proven algorithms. To demonstrate and investigate these novel techniques the authors have selected the domain of web content mining which involves the clustering and classification of web documents based on their textual substance. Several methods of representing web document content by graphs are introduced. An interesting feature of these representations is that they allow for a polynomial time distance computation something which is typically an NP complete problem when using graphs. Experimental results are reported for both clustering and classification in three web document collections using a variety of graph representations, distance measures and algorithm parameters. In addition this book describes several other related topics many of which provide excellent starting points for researchers and students interested in exploring this new area of machine learning further. These topics include creating graph based multiple classifier ensembles through random node selection and visualization of graph based data using multidimensional scaling.

**Foundations of Computational Intelligence** Ajith Abraham, Aboul-Ella Hassanien, André Ponce de Leon F. de Carvalho, 2009-04-21 Foundations of Computational Intelligence Volume 4 Bio Inspired Data Mining Theoretical Foundations and Applications Recent advances in the computing and electronics technology particularly in sensor devices databases and distributed systems are leading to an exponential growth in the amount of data stored in databases It has been estimated that this amount doubles every 20 years For some applications this increase is even steeper Databases storing DNA sequence for

example are doubling their size every 10 months This growth is occurring in several applications areas besides bioinformatics like financial transactions government data environmental monitoring satellite and medical images security data and web As large organizations recognize the high value of data stored in their databases and the importance of their data collection to support decision making there is a clear demand for sophisticated Data Mining tools Data mining tools play a key role in the extraction of useful knowledge from databases They can be used either to confirm a particular hypothesis or to automatically find patterns In the second case which is related to this book the goal may be either to describe the main patterns present in dataset what is known as descriptive Data Mining or to find patterns able to predict behaviour of specific attributes or features known as predictive Data Mining While the first goal is associated with tasks like clustering summarization and association the second is found in classification and regression problems
