## Gender differences in the psychopathology of depressed inpatients

Received: 14 July 2003 / Accepted: 10 November 2003

**Abstract** In the last few years there has been increased scientific effort to describe the gender-specific psychopathological features of depression. Until now these studies have not been entirely conclusive, which could be the result of methodological difficulties. This report investigates sex differences in the symptom presentation in an inpatient population: 104 female and 113 male patients suffering from a depressive episode according to ICD-10 were admitted to the inpatient treatment at the Department of General Psychiatry in Vienna. A psychopathological rating according to the standardized documentation system of the AMDP (Association for Methodology and Documentation in Psychiatry) was performed at admission and discharge. At admission into the hospital women tended to show more affective lability ( $p = 0.025$ ), whereas men had higher scores in affective rigidity ( $p = 0.032$ ), blunted affect ( $p = 0.002$ ), decreased libido ( $p = 0.028$ ), hypochondriasis ( $p = 0.016$ ) and hypochondriac delusions ( $p = 0.039$ ). At discharge from the hospital women had significantly higher scores in dysphoria ( $p = 0.010$ ), while men were more prone to have compulsive impulses ( $p = 0.030$ ). Although our results were obtained in a selected sample of inpatients at a university hospital, they are indicative of psychopathological differences between men and women in the core symptoms of depression. These differences may influence diagnostic practice and gender specific treatment of depression.

### Introduction

Epidemiological studies have consistently yielded differences in the lifetime prevalence of depression (Weissman and Klerman 1977; Kessler et al. 1994; Picinelli et al. 2000). It is widely accepted that the frequency of depressive disorder is about twice as high in females as in males in the general population. Biological, sociological and psychological explanations have been posited for these findings, but none of these explanations have been sufficiently supported by empirical data. However, it has been argued that these findings present an artifact and may be explained by differences in seeking professional help, different presentation of symptoms and different remembering of depressive episodes (Möller-Leimkühler 2002). It has also been proposed that diagnostic instruments meant to measure depressiveness are gender-biased due to a different quality of depressive symptoms between men and women (Young et al. 1990a; Wilhelm and Parker 1994; Weissman et al. 1997).

Up to now several studies have focused on differences in depressive symptomatology. It has been shown that the severity of depression seems to be fairly similar for men and women (Hammen and Padesky 1977; Williamson 1987; Frank et al. 1988; Steer et al. 1989; Maffeo et al. 1990; Young et al. 1990b). However, men tend to report fewer symptoms than women (Angst and Dobler-Mikola 1984; Mitchell and Abbott 1987; Young et al. 1990a; Ernst and Angst 1992), but there have been little or no differences in the quality of depressive symptoms (Frank et al. 1988; Steer et al. 1989; Maffeo et al. 1990; Young et al. 1990a; Fennig et al. 1993). Due to methodological limitations the results from these studies have been rather inconclusive, because mostly typical depressive symptoms have been examined. Atypical symptoms were not assessed, with the consequence that depression in males is probably underdiagnosed.

## **Gender And Psychopathology:**

**Gender and Psychopathology** Ihsan Al-Issa, 2013-10-02 Gender and Psychopathology is a comprehensive review of the connection between gender and psychopathology. The text is divided into five parts. Part I covers the introduction to the central themes discussed such as the connection between gender and patterns of psychopathology, personality disorders, concepts of mental health and models related to gender. Part II deals with the developmental perspective of gender and psychopathology and includes topics such as the relationship between gender and the psychopathology of both the adult and child. Part III talks about topics related to gender and major psychopathology such as gender and depression, schizophrenia and phobia. Part IV covers personality disorders in relation to gender which includes drinking and alcohol abuse, drug use and abuse and crime. Part V discusses gender and mind/body problems such as sexual problems and psychophysiological disorders. The book is recommended for both graduate and advanced undergraduate students who are taking up women's studies, abnormal psychology or counseling.

**Psychopathology in Women** Margarita Sáenz-Herrero, 2019-07-15 This book examines sex and gender differences in the causes and expression of medical conditions including mental health disorders. Sex differences are variations attributable to individual reproductive organs and the XX or XY chromosomal complement. Gender differences are variations that result from biological sex as well as individual self-representation which include psychological, behavioural and social consequences of an individual's perceived gender. Gender is still a neglected field in psychopathology and gender differences is often incorrectly used as a synonym of sex differences. A reconsideration of the definition of gender as the term that subsumes masculinity and femininity could shed some light on this misperception and could have an effect in the study of health and disease. This second edition of Psychopathology clarifies the anthropological, cultural and social aspects of gender and their impact on mental health disorders. It focuses on gender perspective as a paradigm not only in psychopathology but also in mental health disorders. As such it promotes open-mindedness in the definition and perception of symptoms as well as assumptions about those symptoms and raises awareness of mental health.

*Gender and Its Effects on Psychopathology* Ellen Frank, 2008-11-01 Starting in embryonic development, gender has profound influences on us. Endocrine receptors in the brain affect cognition, mood and behavior differently in males and females and gender roles inevitably affect our psychosocial experiences. It should be no surprise that men and women have differences in vulnerability for developing many forms of psychopathology in expression of symptoms and in response to treatment. *Gender and Its Effect on Psychopathology* examines the gender differences in psychopathology including susceptibility to psychiatric disorders, the timing of their onset, their course and their response to treatment. Dr. Ellen Frank and colleagues show how studying these differences helps clinicians in predicting patients' responses to treatment. This book reviews the types of depression to which women are prone, the hormonal basis of mood disorders in women and the specific clinical phenomenology of reproduction-related depressions. Findings on how gender difference in

socialization affect the development and symptoms of psychiatric disorders Studies hormonal and pubertal changes that may explain the rise in rates for depression among females relative to males between ages 10 and 15 years Epidemiological findings on the prevalence of depression among women and discusses plausible explanations for these findings Gender differences in antisocial and borderline personality disorders anxiety disorders schizophrenia and substance dependence A synopsis of current research on gender differences Gender and Its Effects on Psychopathology provides practitioners with invaluable insight into understanding and treating patients with a variety of psychiatric disorders The Cambridge Handbook of the International Psychology of Women Fanny M. Cheung,Diane F. Halpern,2020-08-06 There is a growing knowledge base in understanding the differences and similarities between women and men as well as the diversities among women and sexualities Although genetic and biological characteristics define human beings conventionally as women and men their experiences are contextualized in multiple dimensions in terms of gender sexuality class age ethnicity and other social dimensions Beyond the biological and genetic basis of gender differences gender intersects with culture and other social locations which affect the socialization and development of women across their life span This handbook provides a comprehensive and up to date resource to understand the intersectionality of gender differences to dispel myths and to examine gender relevant as well as culturally relevant implications and appropriate interventions Featuring a truly international mix of contributors and incorporating cross cultural research and comparative perspectives this handbook will inform mainstream psychology of the international literature on the psychology of women and gender *A Handbook for the Study of Mental Health* Allan V. discrepancies are not known This paper focuses on two such psychopathology groups eating disorders and depressive disorders and examines gender differences within a transactional theory of stress that takes into account levels of cognitive processing an expanded transactional theory of stress Both studies found that men are more physiologically reactive to disorder relevant stressful stimuli and stressful events The study on depression also found that different cognitive processes may be depressogenic for men and women deployment of attentional resources toward negative stimuli was associated with depression in men while deployment of attentional resources away from positive stimuli was associated with depression in women These findings have significant implications for choosing appropriate treatment options for men and women

**Mental Disorders in the Social Environment** Stuart A.
