Gene Engineering in Endocrinology. Contemporary Endocrinology Margaret A. Shupnik, 2000 Recent advances in genetic engineering and molecular biology have made it possible to disrupt specific genes in order to determine and better understand their function and clinical significance In **Gene Engineering in Endocrinology** Margaret Shupnik and a team of leading investigators review the most recent breakthroughs emphasizing how studies of natural mutations and gene knockouts have illuminated endocrine processes Using both animal and human model data these authoritative researchers examine in depth the molecular basis of development growth and reproductive processes the specific mutations that explain certain genetic syndromes the hormonal regulation of gene expression which affects the treatment of infertility and steroid dependent cancers and current research directions When possible molecular studies are compared with naturally occurring human and animal gene mutations to establish the difference between complete elimination of or an altered gene function Comprehensive and up to date **Gene Engineering in Endocrinology** offers today's experimental and clinical endocrinologists as well as reproductive biologists a richly informative survey of what has already been accomplished with the genetic engineering of hormone processes and hormone related genetic syndromes research that promises powerful new experimental and therapeutic opportunities as this field continues its rapid development **Endocrinology & Metabolism, March 2001 - February 2002** Paul W. Ladenson, 2000-10 **The Pineal Gland and its Endocrine Role J.**

Axelrod, 2013-12-01 The pineal gland has been a subject of interest and speculation for more than 2000 years Greek anatomists were impressed by the observation that the pineal gland is an unpaired structure and they believed that it regulated the flow of thoughts The philosopher Descartes proposed an important role for this organ in brain function At the beginning of the 20th century experiments by several investigators indicated that the pineal influenced sexual function and skin pigmentation and was also responsive to light signals With the isolation of melatonin from bovine pineal glands by Lerner and coworkers in 1958 the modern era of pineal research was initiated Within a few years the pathway for the biosynthesis of melatonin in the pineal was elucidated Soon thereafter it was shown that the formation of melatonin was influenced by environmental lighting Anatomists found that the pineal was innervated by sympathetic nerves and that the gland had photoreceptor elements It was also shown that the gonads were influenced by light via the pineal gland Research on the pineal gland became of increasing interest to anatomists biochemists pharmacologists and endocrinologists With the expanding knowledge concerning the function of the pineal gland contributed by the wide variety of disciplines it was thought that a study workshop would be timely **Forthcoming Books** Rose Army, 2000-06 *Current Catalog* National Library of Medicine (U.S.), 1985 First multi year cumulation covers six years 1965-70 **Recent Advances of Avian Endocrinology** G. Pethes, P. Péczely, P. Rudas, 2013-10-22 *Advances in Physiological Sciences* Volume 33 **Recent Advances of Avian Endocrinology** covers the proceedings of the satellite symposium on the Recent Advances in Avian Endocrinology that

is held in conjunction with the 28th International Congress of Physiological Sciences The text contains 53 chapters in which the chapters except Chapter 1 are organized into five parts according to the issues they tackle The opening chapter discusses some effects of environmental pollutants on endocrine regulatory mechanisms The next eight chapters cover topics of neuroendocrinology while the next chapter discusses female and male reproduction Part 3 explains prostaglandins and Part 4 tackles thyroid function The final part discusses hormonal control of metabolism Veterinarians biologists ornithologists and other professionals interested in avian endocrinology will find this book a great reference material especially on the nature of the avian endocrine system **National Library of Medicine Current Catalog** National Library of Medicine (U.S.),

Current Catalog, 1991 First multi year cumulation covers six years 1965-70 **Gene Engineering in Endocrinology** Margaret A. Shupnik, 2000-04-01 During the past five to ten years a variety of tools has been developed in the disciplines of both gene engineering and molecular and structural biology Some of these advances have permitted scientists not only to identify and characterize genes but also to target these genes by disruption thus eliminating their function in living animals and to determine the biological responses to altered gene products This has particular significance in endocrine systems in which feedback mechanisms between the hypothalamus pituitary and end organs are critical in normal physiology Interpretation of the physiological significance or the site of action of specific molecules in this context has been difficult prior to transgenic technology Major advances have occurred specifically in the areas of growth and development and of reproduction Coupled with analysis of naturally occurring mutations in humans the use of transgenic animals and in vitro systems has recently allowed endocrinologists to understand the importance of specific thyroid hormone receptor isoforms in vivo the molecular basis for generalized resistance to thyroid hormones via mutations in the nuclear receptor and mechanisms for suppressing gene transcription Previously designated orphan receptors such as steroidogenic factor 1 were demonstrated to have critical roles in development and reproduction Other nuclear receptors including those for thyroid hormone estrogens androgens and progesterone were shown to bind to coactivator and corepressor proteins that modified their transcriptional activity and contributed to the cell specific effects of the hormones **Federation Proceedings** Federation of American Societies for Experimental Biology, 1983-06 Vols for 1942 include proceedings of the American Physiological Society *Information Resources in Toxicology, Volume 2: The Global Arena*, 2020-05-15 This new fifth edition of Information Resources in Toxicology offers a consolidated entry portal for the study research and practice of toxicology Both volumes represent a unique wide ranging curated international annotated bibliography and directory of major resources in toxicology and allied fields such as environmental and occupational health chemical safety and risk assessment The editors and authors are among the leaders of the profession sharing their cumulative wisdom in toxicology's subdisciplines This edition keeps pace with the digital world in directing and linking readers to relevant websites and other online tools Due to the increasing size of the hardcopy publication the current edition has been divided into two volumes to

Endocrine Regulation and Physiological Adaptation of Stress Response in Aquatic Organisms, Volume II Yiming Li, Marco António Campinho, Yi-Feng Li, Juan Fuentes, 2025-01-07 Organismal growth is a multi gene regulatory process that integrates various physiological signaling pathways in vivo from energy metabolism to somatic growth In fully developed animals endocrine regulation assures that homeostasis and growth can adapt the organism to changing environmental and biological conditions thus being the central regulatory hub for physiological responses Much attention has been paid to the endocrine regulation of aquatic

organism growth and regulation These endocrine systems include neuroendocrine and insulin like growth factors and their downstream molecules Many signaling molecules promote tissue growth and regulate the metabolism of many nutrients in vivo Like other animals aquatic animals respond to environmental stimuli through endocrine regulation that modulates physiological and environmental responses Environmental stressors can affect aquatic ecosystems and their inhabitants including but not limited to temperature hypoxia salinity heavy metal nanomaterials pesticides microplastics and other toxic pollutants The presence of stress disrupts the homeostasis of aquatic animals inducing physiological molecular and behavioral changes Research into the endocrine regulation and physiological adaptation in aquatic organisms and the molecular mechanisms involved can aid in forecasting danger and assessing physiological well being That has never been more present than now amid climate change where aquatic environments are amongst the most susceptible biomes This research topic addresses these emergent questions by inviting studies investigating and discussing the molecular and cellular mechanisms of endocrine regulation and physiological adaptation in aquatic organisms to environmental stresses Gaining an insight into the current knowledge of these responses and the related mechanisms will give us a deeper understanding of aquatic animal biology and adaptation
