Inducible Gene Expression, Volume 1 P.A. Baeuerle, 2013-12-01 Cells have evolved multiple strategies to adapt the composition and quality of their protein equipment to needs imposed by changes in intra and extracellular conditions The appearance of proteins transmitting novel functional properties to cells can be controlled at a transcriptional, posttranscriptional, translational or posttranslational level Extensive research over the past 15 years has shown that transcriptional regulation is used as the predominant strategy to control the production of new proteins in response to extracellular stimuli At the level of gene transcription the initiation of mRNA synthesis is used most frequently to govern gene expression The key elements controlling transcription initiation in eukaryotes are activator proteins, transactivators that bind in a sequence specific manner to short DNA sequences in the 5' of genes The activator binding sites are elements of larger proximity control units called promoters and enhancers which bind many distinct proteins These may synergize or negatively cooperate with the activators The *de novo* binding of an activator to DNA or if already bound to DNA its functional activation is what ultimately turns on a high level expression of genes The activity of transactivators is controlled by signalling pathways and in some cases transactivators actively participate in signal transduction by moving from the cytoplasm into the nucleus In this first volume of Inducible Gene Expression leading scientists in the field review six eukaryotic transactivators that allow cells to respond to various extracellular stimuli by the expression of new proteins

Regulation of Gene Expression in Enteropathogenic Bacteria, Volume II Dongsheng Zhou, Shihua Wang, Xihui Shen, 2021-01-22 Following the success of this Research Topic <http://journal.frontiersin.org/researchtopic/3298> regulation of gene expression in enteropathogenic bacteria we are happy to launch a second edition of the project Pathogenic bacteria have evolved numerous strategies to survive in and to attack hosts which can be reflected by transcriptional and posttranscriptional changes in specific genes especially including those encoding virulence determinants Regulation of gene expression by regulatory proteins and non coding RNAs enables the pathogens to adapt their metabolic needs and to coordinately express virulence determinants during different stages of infection

Srivastava, 2024-01-11 This Research Topic is part of a series with Multi targeted Natural Products as Cancer Therapeutics Challenges and Opportunities Volume II Cancer remains a leading cause of disease related deaths worldwide despite recent advances in our understanding of cancer initiation progression and metastasis Chemotherapy and radiotherapy have been used as standard non surgical treatments of human cancer for decades however the survival rates of patients with cancer especially those with advanced diseases are still very low due to the high toxicities of these treatments as well as the severe side effects This fact has motivated researchers to discover new cancer therapeutics with minimum side effects which intensively promotes the rapid development of single specific molecule targeted therapies SSMITT Many efforts have been made in world wide cancer drug discovery research and several single molecule targeted therapies have been successfully developed Unfortunately most of the investments failed because cancer is a genetic disease and always harbors multiple alternations of molecules or genes at the genomic genetic and epigenetic levels The inhibition of a single molecule

or signaling pathway by SSMTT frequently results in a hyperactive compensation of other cancer related molecules and signaling pathways as well as the subsequent development of drug resistance Therefore identifying multi targeted therapies i.e. drugs that are able to target multiple cancer related genes proteins or signaling pathways is a more promising way to success in developing new cancer therapeutics Natural products especially those from traditional Chinese medicine and folk remedies in other countries are an extraordinarily important source for new drug discovery over the past decades Of note many natural products have often been demonstrated to target several crucial genes or proteins in cancer related signaling networks and exert synergistic effects For example Japonicone A a dimeric sesquiterpenoid from the medicinal plant *Inula japonica* has been found to inhibit tumor growth and metastasis by dually targeting the TNF NF B and p53 MDM2 signaling pathways Traditionally researchers have believed that the multi targeting mechanisms of natural products have limited their use in cancer treatment due to the low specificity and potential side effects The growing interest in developing multi targeted cancer therapies may provide another golden opportunity to develop natural products as new cancer therapeutics Nevertheless critical investigations for a comprehensive understanding of the molecular mechanisms of natural products also mean more challenges Our long term goals are to fully understand the molecular targets and mechanisms of action of anticancer natural products and develop them as novel cancer preventive and therapeutic agents The specific goal of this Research Topic is to bring together the recent findings of newly identified anticancer natural products especially those with multiple molecular targets Papers Original Research articles or Reviews which discuss the in vitro and in vivo efficacy and pharmacological and toxicological properties of natural products are also welcome to be submitted Guidelines for the conception and review of submissions As many anticancer drugs working as cytotoxic compounds have non selective effects annihilating their potential therapeutic benefits manuscripts are advised to provide evidence of a significant selectivity towards cancer cells vs healthy cells Specifically if the studied anticancer drug or modality does not target an oncogenic pathway the authors should make every effort possible to prove that the cytotoxic or cytostatic effects they have identified exhibit selectivity for cancer cells ideally 1 log difference in EC₅₀ or IC₅₀ vs non malignant cells eg fibroblasts or primary culture of cells The authors should also demonstrate the applicability of their anticancer modalities on a minimum of two well authenticated cancer cell lines ideally originating from distinct organs tissues For manuscripts dealing with plant extracts or other natural substances compounds the composition and the stability of the study material must be described in sufficient detail In particular for extracts chromatograms with characterization of the dominating compound s are requested The level of purity must be proven and included Please refer to the Four Pillars of Best Practice in Ethnopharmacology a subset of which concerning general standards in natural product research are applied to all such studies in all sections of Frontiers in Pharmacology
