Mechanisms in B-Cell Neoplasia 1988 Michael Potter, Fritz Melchers, 2013-03-07 The papers in this book were presented at the 6th Workshop on Mechanisms in B Cell Neoplasia held in Bethesda March 23 25 1988 On alternate years this meeting is sponsored by the Basel Institute of Immunology in Basel Switzerland and by the National Cancer Institute in Bethesda and is attended by 100 to 150 participants This 6th workshop like the preceding five was characterized by intense and enthusiastic discussion which reflects we think the exciting growth and development of this field It is quite clear however that despite many general advances an understanding of the precise underlying mechanisms in B cell tumor development is not yet defined Probably there is no single mechanism for all the various forms of B cell neoplastic development Many different forms of B cell neoplasms are known and these are distinguished by several characteristics 1 the stage of development attained by the tumor stem cells 2 mode of growth slow or fast 3 association with natural or inductive etiologic agents and 4 specific and consistent mutational mechanisms such as retroviral insertion chromosomal rearrangement Those characteristic forms which arise naturally in relatively high frequency or those tumors with hallmark properties which can be induced consistently are the models most frequently studied e g endemic Burkitt's lymphoma follicular lymphoma acute and chronic lymphocytic leukemia and multiple myeloma in man bursal lymphoma in chickens Abelson virus induced pre B cell lymphomas and plasmacytomas in mice and immunocytomas in rats Each model system has special problems and advantages

Malignant Lymphomas and Hodgkin's Disease: Experimental and Therapeutic Advances Franco Cavalli, Gianni Bonadonna, Marcel Rozenzweig, 2012-12-06 Malignant lymphomas remain a fascinating research topic for clinicians as well as basic scientists Rapidly increasing technical sophistication expanded knowledge and broader implications of new findings underline the need for a forum to integrate the latest developments in the multiple areas involved in the challenging study of lymphoid malignancies This volume includes contributions of renowned experts and is based on a selection of papers presented at the Second International Conference on Malignant Lymphomas that was held in Lugano Switzerland in June 1984 Updated information is provided on various experimental fields including cell biology immunology genetics and cell biochemistry Particular attention has been given to special clinical entities such as the lymphomas associated with the Acquired Immune Deficiency Syndrome Recent advances in the treatment of Hodgkin's disease and non-Hodgkin's lymphomas and childhood lymphomas are highlighted with emphasis on growing experience with new therapeutic approaches including monoclonal antibodies and bone marrow transplantation The contents of the volume reflect and translate numerous avenues of exploration While there might be some unavoidable overlap most appear essentially complementary The intent of the Program Committee of the Second International Conference on Malignant Lymphomas was to promote further interactions between all those who are devoting major efforts to elucidate the nature of these diseases or

their optimal therapy This volume will hopefully amplify this objective The Editors wish to thank the contributors for delivering the manuscripts on schedule Biomedical Index to PHS-supported Research: pt. A. Subject access A-H ,1992

Division of Research Grants,1975 *Stem Cells Handbook* Stewart Sell,2003-10-22 The power of stem cells for tissue development regeneration and renewal has been well known by embryologists and developmental biologists for many years Those presently active in research in the stem cell field owe much to previous work by embryologists and cancer researchers for their insights into what stem cells can do In the last 4 5 years the rapid expansion of the concept of adult tissue stem cells as pluripotent progenitors for various tissues has led to an even greater appreciation of the power of stem cells The demonstration that both embryonic and adult tissue stem cells have the ability to produce progenitor cells for tissue renewal has opened vast possibilities for treatment of congenital deficiency diseases as well as for regeneration of damaged tissues Older concepts of determination leading to loss of potential during differentiation of adult tissues are being replaced by newer ideas that cells with multiple potential exist in different forms in various adult organs and that cells thought to be restricted to differentiation to one cell type may be able to transdifferentiate into other tissue cell types Thus the concept of embryonic rests in adult tissues hypothesized to be the cellular origin of cancer by Durante and Conheim in the 1870s now can be expanded to include survival of pluripotential embryonic like stem cells in adult tissues *Cancer Research* ,2000
