Gene Expression In Recombinant Microorganisms:

Gene Expression in Recombinant Microorganisms Alan Smith, 1994-11-23 Describing the scientific and commercial applications of microbial recombinant DNA technology this outstanding single source reference offers state of the art reviews of gene expression in the most important classes of recombinant microorganisms providing numerous examples of the expression of homologous genes or heterologous gene products Presents a unique collection of safety and regulatory considerations from around the world and addresses specific measures to be taken for large scale industrial operations

Recombinant protein expression in microbial systems Eduardo A. Ceccarelli, Germán L. Rosano, 2014-10-02 With the advent of recombinant DNA technology expressing heterologous proteins in microorganisms rapidly became the method of choice for their production at laboratory and industrial scale Bacteria yeasts and other hosts can be grown to high biomass levels efficiently and inexpensively Obtaining high yields of recombinant proteins from this material was only feasible thanks to constant research on microbial genetics and physiology that led to novel strains plasmids and cultivation strategies Despite the spectacular expansion of the field there is still much room for progress Improving the levels of expression and the solubility of a recombinant protein can be quite challenging Accumulation of the product in the cell can lead to stress responses which affect cell growth Buildup of insoluble and biologically inactive aggregates inclusion bodies lowers the yield of production This is particularly true for obtaining membrane proteins or high molecular weight and multi domain proteins Also obtaining eukaryotic proteins in a prokaryotic background for example plant or animal proteins in bacteria results in a product that lack post translational modifications often required for functionality Changing to a eukaryotic host yeasts or filamentous fungi may not be a proper solution since the pattern of sugar modifications is different than in higher eukaryotes Still many advances in the last couple of decades have provided to researchers a wide variety of strategies to maximize the production of their recombinant protein of choice Everything starts with the careful selection of the host Be it bacteria or yeast a broad list of strains is available for overcoming codon use bias incorrect disulfide bond formation protein toxicity and lack of post translational modifications Also a huge catalog of plasmids allows choosing for different fusion partners for improving solubility protein secretion chaperone co expression antibiotic resistance and promoter strength Next controlling culture conditions like temperature inducer and media composition can bolster recombinant protein production With this Research Topic we aim to provide an encyclopedic account of the existing approaches to the expression of recombinant proteins in microorganisms highlight recent discoveries and analyze the future prospects of this exciting and ever growing field
