Hennig, 2013-06-05 One of the oldest problems in developmental biology is the differentiation between germ line and somatic cells The continuity of germ line cells between subsequent generations of multicellular organisms was first suggested by Owen and later elaborated by A Weismann to his famous germ line theory His additional assumption that cellular differentiation was based on a differential representation of the genetic material in somatic cells was soon disproved In some apparently exceptional cases however such differences in the genetic material between germ line and somatic cells were discovered The best known example is the nematode *Ascaris* Boveri discovered and studied the fundamental differences in the karyotypes of germ line and soma of *Parascaris equorum* Later similar situations were found in some other organisms However in particular the work of Spemann demonstrated that cellular differentiation in general is not accompanied by fundamental changes of the genetic material Subsequently the relatively few examples of germ line soma differences achieved by chromatin elimination processes have been considered as a curiosity Experimental studies have been essentially restricted to *Ascaris* species and to the pioneering cytological studies of chromatin elimination by S Beermann Despite the large proportions of the genome involved in chromatin elimination our knowledge of this process is still very restricted In particular the biological meaning of this differentiation process is entirely obscure In this context one must however consider that also for the majority of DNA sequences in eukaryotic genomes the biological relevance is unclear *Bibliography of Agriculture*, 1966 *The Publishers' Trade List Annual*, 1980 **Handbooks for the Identification of British Insects**, 1983 **Handbooks for the Identification of British Insects** Royal Entomological Society of London, 1983 *Zoological Catalogue of Australia*, 1983 The published works are derived from the Zoological catalogue of Australia database Taxa in the Australian fauna are divided among volumes to form sets of about 1800 2000 species available names such that each volume comprises the whole or part of one or more major groups *Pacific Insects*, 1974 **Handbook of Genetics: Invertebrates of genetic interest** Robert C.
