**Gene Therapy** Mauro Giacca,2010-11-01 I entered the gene therapy field in the mid 1990s being fascinated by the immense potential of genes as drugs for the treatment of human disease Since then I have experienced the ups and downs of this discipline and tried to contribute with my work and that of my laboratory to the development of innovative approaches to the treatment of cardiovascular disorders During these years I have had several opportunities to speak on gene therapy at lectures and academic lessons and have often noticed that the field is very attractive to scientists of all disciplines However as yet no comprehensive book on the subject has been published Indeed most books in the field are either a collection of gene transfer laboratory protocols or deal with the subject in a rather superficial manner Hence the idea to write a gene therapy textbook that is broad and comprehensive but at the same time provides sufficient molecular and clinical detail to be of interest to students professors and specialists in the various disciplines that contribute to gene therapy I have tried to keep the language plain and whenever possible non technical Since the book is intended to be a textbook in the field of gene therapy in both the basic science and clinical areas whenever technical descriptions are required they are provided

progressive cardiac decompensation one of the most common chronic medical conditions that affect around 2% of the adult population worldwide irrespective of ethnic and geographic origin Anonymous Apart from ischemic heart disease hypertension infection and inflammation several other etiologic factors account for irreparable and irreversible myocardial damage leading to heart failure HF Genetic and genomic factors are now increasingly identified as one of the leading underlying factors Arab and Liu 2005 These factors may be related to pathogenic alterations mutation or polymorphism within specific cardiac genes mutations in genes incorporating single or multiple molecular pathways protein families relevant to cardiac structure and or function genetic or genomic polymorphisms of uncertain significance gene variants single nucleotide polymorphisms SNPs and copy number variations CNVs and epigenetic or epigenomic changes that influence cardiac gene functions scattered across the human genome Recent genetic and genomic studies in both systolic and diastolic ventricular dysfunction the hallmark of CHF have revealed a number of mutations in genes belonging to specific cardiac protein families For example around 200 mutations are now known to exist in around 15 genes coding for several different types of sarcomere proteins Liew and Dzau 2004 The sarcomere protein family alone accounts for the bulk of inherited cardiomyopathies including hypertrophic cardiomyopathy HCM dilated cardiomyopathy DCM restrictive cardiomyopathy RCM and left ventricular LV non compaction LVNC In addition there are several other potentially relevant factors involving different genes and genome level elements This article presents a systematic account on the available factual information and interpretations based on genetic and genomic studies in CHF Liew and Dzau 2004 Genomic and molecular approaches have opened the way for a renewed debate for taxonomy of CHF Ashrafian and Watkins 2007 The review draws attention to the potential diagnostic and therapeutic implications of genomic and transcriptional profiling in HF and translational genomics research that is likely to permit greater personalization of prevention and treatment strategies to address the complexities of managing clinical HF Creemers Wilde et al 2011
