Abstract

Carathéodory showed that n complex numbers $c_1, \ldots, c_n$ can uniquely be written in the form $c_p = \sum_{j=1}^{m} \rho_j \epsilon_j{}^p$ with $p = 1, \ldots, n$, where the ϵ_js are different unimodular complex numbers, the ρ_js are strictly positive numbers and integer m never exceeds n. We give the conditions to be obeyed for the former property to hold true if the ρ_js are simply required to be real and different from zero. It turns out that the number of the possible choices of the signs of the ρ_js are at most equal to the number of the different eigenvalues of the Hermitian Toeplitz matrix whose i, j-th entry is c_{j-i}, where c_{-p} is equal to the complex conjugate of c_p and $c_0 = 0$. This generalization is relevant for neutron scattering. Its proof is made possible by a lemma - which is an interesting side result - that establishes a necessary and sufficient condition for the unimodularity of the roots of a polynomial based only on the polynomial coefficients.
