Janet McDonald,2012-12-06 Today environmental problems of unprecedented magnitude confront planet earth The sobering fact is that a whole range of human activities is affecting our global environment as profoundly as the billions of years of evolution that preceded our tenure on Earth The pressure on vital natural resources in the developing world and elsewhere is intense and the destruction of tropical forests wildlife habitat and other irreplaceable resources is alarming Climate change ozone depletion loss of genetic diversity and marine pollution are critical global environmental concerns Their cumulative impact threatens to destroy the planet s natural resources The need to address this situation is urgent More than at any previous moment in history nature and ecological systems are in human hands dependent on human efforts The earth is an interconnected and interdependent global ecosystem and change in one part of the system often causes unexpected change in other parts Atmospheric oceanic wetland terrestrial and other ecological systems have a finite capacity to absorb the environmental degradation caused by human behavior The need for an environmentally sound sustainable economy to ease this degradation is evident and urgent Policies designed to stimulate economic development by foregoing pollution controls both destroy the long term economy and ravage the environment Over the years we have sometimes drawn artificial distinctions between the health of individuals and the health of ecosystems But in the real world those distinctions do not exist

Ecosystem Concepts for Sustainable Bivalve Mariculture National Research Council, Division on Earth and Life Studies, Ocean Studies Board, Committee on Best Practices for Shellfish Mariculture and the Effects of Commercial Activities in Drakes Estero, Pt. Reyes National Seashore, California, 2010-04-18 U S mariculture production of bivalve molluscs those cultivated in the marine environment has roughly doubled over the last 25 years Although mariculture operations may expand the production of seafood without additional exploitation of wild populations they still depend upon and affect natural ecosystems and ecosystem services Every additional animal has an incremental effect arising from food extraction and waste excretion Increasing domestic seafood production in the United States in an environmentally and socially responsible way will likely require the use of policy tools such as best management practices BMPs and performance standards BMPs represent one approach to protecting against undesirable consequences of mariculture An alternative approach to voluntary or mandatory BMPs is the establishment of performance

standards for mariculture Variability in environmental conditions makes it difficult to develop BMPs that are sufficiently flexible and adaptable to protect ecosystem integrity across a broad range of locations and conditions An alternative that measures performance in sustaining key indicators of ecosystem state and function may be more effective Because BMPs address mariculture methods rather than monitoring actual ecosystem responses they do not guarantee that detrimental ecosystem impacts will be controlled or that unacceptable impact will be avoided Ecosystem Concepts for Sustainable Bivalve Mariculture finds that while performance standards can be applied for some broad ecosystem indicators BMPs may be more appropriate for addressing parameters that change from site to site such as the species being cultured different culture methods and various environmental conditions This book takes an in depth look at the environmental social and economic issues to present recommendations for sustainable bivalve mariculture
