Best Practices in Software Measurement Christof Ebert, Reiner Dumke, Manfred Bundschuh, Andreas Schmietendorf, 2005-09-12 Not everything that counts can be counted Not everything that is counted counts Albert Einstein This is a book about software measurement from the practitioner s point of view and it is a book for practitioners Software measurement needs a lot of practical guidance to build upon experiences and to avoid repeating errors This book t gets exactly this need namely to share experiences in a constructive way that can be followed It tries to summarize experiences and knowledge about software measurement so that it is applicable and repeatable It extracts experiences and lessons learned from the narrow context of the specific industrial situation thus facilitating transfer to other contexts Software measurement is not at a standstill With the speed software engine ing is evolving software measurement has to keep pace While the underlying theory and basic principles remain invariant in the true sense after all they are not specific to software engineering the application of measurement to specific contexts and situations is continuously extended The book thus serves as a ref ence on these invariant principles as well as a practical guidance on how to make software measurement a success

New Methods for Measuring and Analyzing Segregation Mark Fossett, 2017-09-14 This book is open access under a CC BY NC 2 5 license This book introduces new methods for measuring and analyzing residential segregation It begins by placing all popular segregation indices in the difference of group means framework wherein index scores can be obtained as simple differences of group means on individual level residential attainments scored from area racial composition Drawing on the insight that in this framework index scores are additively determined by individual residential attainments the book shows that the level of segregation in a given city can be equated to the effect of group membership e g race on individual residential attainments This unifies separate research traditions in the field by joining the analysis of segregation at the aggregate level with the analysis of residential attainments for individuals Next it shows how segregation analysis can be extended by using multivariate attainment models to assess the impact of group membership i e the level of segregation for a city while including controls for other relevant individual characteristics e g income education language nativity etc It then illustrates how one can use these models to quantitatively assess the extent to which segregation traces to impacts of group membership on residential attainments versus other factors such as group differences in income The book then shows how micro level attainment models can be used to study macro level variation in segregation specifically by estimating multi level models of individual residential attainments to assess how the effect of group membership i e segregation index scores vary with city characteristics Finally the book introduces refined versions of popular indices that are free of the vexing problem of upward bias This improves the quality of segregation measurement

directly at the level of individual cases and expanding the number of cases that can be safely included in empirical studies
