*Electronic Steering and Suspensions Systems* Ronald K. Jurgen, Society of Automotive Engineers, 1999 While there are many advantages of electronic systems in automobiles one significant savings lies where electrical and electronic components actually replace conventional mechanical and electromechanical components Such is the case with electric power assisted steering systems steer by wire and active steering systems Electronics Steering and Suspension Systems is a collection of 64 technical papers containing research conducted in the last five years on the latest developments in these topics The section on Electronic Steering Systems covers electro hydraulic power steering magnetic power steering intelligent steering systems active rear steer systems four wheel steering systems steer by wire and multi axle steering systems The section on Electronic Suspension Systems covers active passive and semi active suspension systems electromagnetics damper suspension digital suspension control and vibration and handling control systems Many of the advancements discussed in these papers have yet to appear in production automobiles or appear only in limited production high end models As electronic systems become more sophisticated and costs become more affordable many of these advancements are likely to become available in mid range production automobiles Official Gazette of the United States Patent and Trademark Office ,2003

**Reducing Braking Distance by Control of Semi-Active Suspension** Tobias Niemz, 2014-04-11 Inhaltsangabe Abstract This thesis presents a control algorithm for semi active suspensions to reduce the braking distance of passenger cars Active shock absorbers are controlled and used to influence the vertical dynamics during ABS controlled full braking In today s series cars the active shock absorbers are switched to a passive damping usually hard damping during ABS braking Several approaches to reduce oscillations of vertical dynamic tire forces are known implemented and some of them tested in non braking situations refer to Yi Val ek and Nouillant The approach presented in this paper goes a step further by connecting the vertical with the longitudinal dynamics To influence the vertical dynamics a switching control logic called MiniMax controller is used It is named after the fact that it changes only from soft to hard damping and vice versa A control quantity was identified that connects the vertical dynamics with the longitudinal dynamics the integral of dynamic wheel load The control algorithm is implemented in a compact class passenger car Simulations with a quarter car model have been undertaken as well as tests on a 4 post test rig driving tests with defined excitations like defined obstacles and test drives on a real road using a braking machine for reproducibility reasons It could be shown that it is possible to reduce the braking distance by affecting on the vertical dynamics of a passenger car in general The amount of reduction depends on the elevation profile of the chosen testing track and on the initial velocity On a road with an unevenness comparable to the one that is found on a typical German Autobahn a reduction of typically 1 2% compared to the best passive damping was achieved Inhaltsverzeichnis Table of Contents List of Abbreviationsix List of Symbols and Indicesx Abstractxv 1 Introduction1 1 1Classification of Suspension Systems1 1 2State of the Art3 1 3Research Objectives11 1 4Methodology12 2 Fundamentals of Vehicle Dynamics14 2 1Coordinate Systems14 2 2The Braking Process16 2 2 1The Quality of a Braking Process23 2 2 2Parameters that Influence the Braking Distance24 2 3Possibilities to Influence
