Ordering Phenomena in Rare-Earth Nickelate Heterostructures Matthias

Hepting, 2017-06-28 This thesis presents an experimental study of ordering phenomena in rare earth nickelate based heterostructures by means of inelastic Raman light scattering and elastic resonant x ray scattering RXS Further it demonstrates that the amplitude ratio of magnetic moments at neighboring nickel sites can be accurately determined by RXS in combination with a correlated double cluster model and controlled experimentally through structural pinning of the oxygen positions in the crystal lattice The two key outcomes of the thesis are a demonstrating full control over the charge bond and spin order parameters in specifically designed praseodymium nickelate heterostructures and observation of a novel spin density wave phase in absence of the charge bond order parameter which confirms theoretical predictions of a spin

Molecular Imaging: Basic Principles And Applications In Biomedical Research (3rd Edition) Markus Rudin, 2020-04-04

The area of molecular imaging has matured over the past decade and is still growing rapidly Many concepts developed for molecular biology and cellular imaging have been successfully translated to in vivo imaging of intact organisms Molecular imaging enables the study of processes at a molecular level in their full

biological context Due to the high specificity of the molecular readouts the approach bears a high potential for diagnostics It is fair to say that molecular imaging has become an indispensable tool for biomedical research and drug discovery and development today This volume familiarizes the reader with the concepts of imaging and molecular imaging in particular Basic principles of imaging technologies reporter moieties for the various imaging modalities and the design of targeted probes are described in the first part The second part illustrates how these tools can be used to visualize relevant molecular events in the living organism Topics covered include the studies of the biodistribution of reporter probes and drugs visualization of the expression of biomolecules such as receptors and enzymes and how imaging can be used for analyzing consequences of the interaction of a ligand or a drug with its molecular target by visualizing signal transduction or assessing the metabolic physiological or structural response of the organism studied The third edition has been extended considerably This holds for the chapter on imaging modalities which now includes sections on intravital microscopy and mass spectrometric imaging All chapters have been updated and a new chapter on the challenges of translating molecular imaging solutions for clinical use has been added

Fundamentals of Powder Diffraction and Structural Characterization of Materials, Second Edition Vitalij Pecharsky, Peter Zavalij, 2008-11-24 A little over ve years have passed since the rst edition of this book appeared in print Seems like an instant but also eternity especially considering numerous developments in the hardware and software that have made it from the laboratory test beds into the real world of powder diffraction This prompted a revision which had to be beyond cosmetic limits The book was and remains focused on standard laboratory powder diffractometry It is still meant to be used as a text for teaching students about the capabilities and limitations of the powder diffraction method We also hope that it goes beyond a simple text and therefore is useful as a reference to practitioners of the technique The original book had seven long chapters that may have made its use as a text convenient So the second edition is broken down into 25 shorter chapters The rst fteen are concerned with the fundamentals of powder diffraction which makes it much more logical considering a typical 16 week long semester The last ten ch ters are concerned with practical examples of structure solution and re nement which were preserved from the rst edition and expanded by another example R solving the crystal structure of Tylenol

Ion Correlations at Electrified Soft Matter Interfaces Nouamane Laanait, 2013-07-30 Ion Correlations at Electrified Soft Matter Interfaces presents an investigation that combines experiments theory and computer simulations to demonstrate that the interdependency between ion correlations and other ion interactions in solution can explain the distribution of ions near an electrified liquid liquid interface The properties of this interface are exploited to vary the coupling strength of ion ion correlations from weak to strong while monitoring their influence on ion distributions at the nanometer scale with X ray reflectivity and on the macroscopic scale with interfacial tension measurements This thesis demonstrates that a parameter free density functional theory that includes ion ion correlations and ion solvent interactions is in agreement with the data over the entire range of experimentally tunable

correlation coupling strengths The reported findings represent a significant advance towards understanding the nature and role of ion correlations in charged soft matter Ion distributions underlie many scientific phenomena and technological applications including electrostatic interactions between charged biomolecules and the efficiency of energy storage devices These distributions are determined by interactions dictated by the chemical properties of the ions and their environment as well as the long range nature of the electrostatic force The presence of strong correlations between ions is responsible for counterintuitive effects such as like charge attraction Small Angle Scattering and Diffraction Margareth Kazuyo Kobayashi Dias Franco,Fabiano Yokaichiya,2018-06-06 Reasoned and based on the difference between discovery and invention according to the traditional conception science can be distinguished between basic science and applied science Nevertheless we know that the sciences are inseparable A century or more ago Louis Pasteur said there is no applied science there are applications of science With this assertion he establishes the logic of complementarity between them Science certainly goes beyond its own material application and brings us to issues that have intrigued humanity for a long time During the many years that we have been working with techniques of material characterization we observed that this complementarity was not always understood by the researchers In line with the reasoning that the technique joined with science generates technology the application of techniques that use x ray and neutron sources seems to us of fundamental importance for the development of technology In this way we present in this book how the existing technology of material characterization can contribute to science and applied technology The authors who contributed with this book sought to show the importance of applying the existing techniques in the development of their works **III-V Compound**

Semiconductors Tingkai Li,Michael Mastro,Armin Dadgar,2016-04-19 Silicon based microelectronics has steadily improved in various performance to cost metrics But after decades of processor scaling fundamental limitations and considerable new challenges have emerged The integration of compound semiconductors is the leading candidate to address many of these issues and to continue the relentless pursuit of more Thin metal films on weakly-interacting substrates Andreas Jamnig,2020-09-30 Vapor based growth of thin metal films with controlled morphology on weakly interacting substrates WIS including oxides and van der Waals materials is essential for the fabrication of multifunctional metal contacts in a wide array of optoelectronic devices Achieving this entails a great challenge since weak film substrate interactions yield a pronounced and uncontrolled 3D morphology Moreover the far from equilibrium nature of vapor based film growth often leads to generation of mechanical stress which may further compromise device reliability and functionality The objectives of this thesis are related to metal film growth on WIS and seek to i contribute to the understanding of atomic scale processes that control film morphological evolution ii elucidate the dynamic competition between nanoscale processes that govern film stress generation and evolution and iii develop methodologies for manipulating and controlling nanoscale film morphology between 2D and 3D Investigations focus on magnetron sputter deposited Ag and Cu films on SiO₂ and amorphous carbon a C

substrates Research is conducted by strategically combining of in situ and real time film growth monitoring ex situ chemical and micro structural analysis optical modelling and deterministic growth simulations In the first part the scaling behavior of characteristic morphological transition thicknesses i e percolation and continuous film formation thickness during growth of Ag and Cu films on a C are established as function of deposition rate and temperature These data are interpreted using a theoretical framework based on the droplet growth theory and the kinetic freezing model for island coalescence from which the diffusion rates of film forming species during Ag and Cu growth are estimated By combining experimental data with ab initio molecular dynamics simulations diffusion of multiatomic clusters rather than monomers is identified as the rate limiting structure forming process In the second part the effect of minority metallic or gaseous species Cu N₂ O₂ on Ag film morphological evolution on SiO₂ is studied By employing in situ spectroscopic ellipsometry it is found that addition of minority species at the film growth front promotes 2D morphology but also yields an increased continuous layer resistivity Ex situ analyses show that 2D morphology is favored because minority species hinder the rate of coalescence completion Hence a novel growth manipulation strategy is compiled in which minority species are deployed with high temporal precision to selectively target specific film growth stages and achieve 2D morphology while retaining opto electronic properties of pure Ag films In the third part the evolution of stress during Ag and Cu film growth on a C and its dependence on growth kinetics as determined by deposition rate substrate temperature is systematically investigated A general trend toward smaller compressive stress magnitudes with increasing temperature deposition rate is found related to increasing grain size decreasing adatom diffusion length Exception to this trend is found for Cu films in which oxygen incorporation from the residual growth atmosphere at low deposition rates inhibits adatom diffusivity and decreases the magnitude of compressive stress The effect of N₂ on stress type and magnitude in Ag films is also studied While Ag grown in N₂ free atmosphere exhibits a typical compressive tensile compressive stress evolution as function of thickness addition of a few percent of N₂ yields to a stress turnaround from compressive to tensile stress after film continuity which is attributed to giant grain growth and film roughening The overall results of the thesis provide the foundation to i determine diffusion rates over a wide range of WIS film substrates systems ii design non invasive strategies for multifunctional contacts in optoelectronic devices iii complete important missing pieces in the fundamental understanding of stress which can be used to expand theoretical descriptions for predicting and tuning stress magnitude La morphologie de films minces m talliques polycristallins labor s par condensation d une phase vapeur sur des substrats faible interaction SFI poss de un caract re 3D intrins que De plus la nature hors quilibre de la croissance du film depuis une phase vapeur conduit souvent la g n ration de contraintes m caniques ce qui peut compromettre davantage la fiabilit et la fonctionnalit des dispositifs opto lectroniques Les objectifs de cette th se sont li s la croissance de films m talliques sur SFI et visent i contribuer une meilleure compr hension des processus l chelle atomique qui contr lent l volution morphologique des films ii lucider les processus dynamiques qui r

gissent la génération et l'évolution des contraintes en cours de croissance et iii) développer des méthodologies pour manipuler et contrôler la morphologie des films à l'échelle nanométrique. L'originalité de l'approche mise en œuvre consiste à suivre la croissance des films in situ et en temps réel par couplage de plusieurs diagnostics complétés par des analyses microstructurales ex situ. Les grandeurs mesurées sont confrontées à des modèles optiques et des simulations atomistiques. La première partie est consacrée à l'étude du comportement de l'ordonnement des paquets de transition morphologiques caractéristiques, savoir la percolation et la continuité du film lors de la croissance de films polycristallins d'Ag et de Cu sur carbone amorphe a-C. Ces grandeurs sont examinées de façon systématique en fonction de la vitesse de dépôt et de la température du substrat et interprétées dans le cadre de la théorie de la croissance de gouttelettes suivant un modèle cinétique décrivant la coalescence de lots, à partir duquel les coefficients de diffusion des espèces métalliques sont estimés. En confrontant les données expérimentales des simulations par dynamique moléculaire ab initio, la diffusion de clusters multiatomiques est identifiée comme l'étape limitante du processus de croissance. Dans la seconde partie, l'incorporation et l'impact sur la morphologie d'espèces métalliques ou gazeuses minoritaires Cu, N₂, O₂ lors de la croissance de film Ag sur SiO₂ est étudiée. À partir de mesures ellipsométriques in situ, on constate que l'addition d'espèces minoritaires favorise une morphologie 2D en ralentissant le taux d'achèvement de la coalescence, mais donne également lieu à une rugosité accrue de la couche continue. Par conséquent, une stratégie de manipulation de la croissance est proposée dans laquelle des espèces minoritaires sont déposées avec une grande précision temporelle pour cibler sélectivement des stades de croissance de film spécifiques et obtenir une morphologie 2D tout en conservant les propriétés optoélectroniques des films d'Ag pur. Dans la troisième partie, l'évolution des contraintes résiduelles lors de la croissance des films d'Ag et de Cu sur a-C et leur dépendance à la cinétique de croissance est systématiquement étudiée. On observe une tendance générale vers des amplitudes de contrainte de compression plus faibles avec une augmentation de la température, la vitesse de dépôt et l'augmentation de la taille des grains, la diminution de la longueur de diffusion des adatoms, ainsi que l'ajout dans le plasma de N₂ sur le type et l'amplitude des contraintes dans les films d'Ag est étudiée. L'ajout de quelques pourcents de N₂ en phase gazeuse donne lieu à un renversement de la contrainte de compression et à une évolution en tension au-delà de la continuité du film. Cet effet est attribué à une croissance anormale des grains géants et au développement de rugosité de surface. L'ensemble des résultats obtenus dans cette thèse fournissent les bases pour identifier les coefficients de diffusion sur une large gamme de systèmes films/SFI, ii) concevoir des stratégies non invasives pour les contacts multifonctionnels dans les dispositifs optoélectroniques, iii) apporter des éléments de compréhension l'origine du développement de contrainte qui permettent de prédire et contrôler le niveau de contrainte intrinsèque que la croissance de films minces polycristallins. *Spin Spirals and Charge Textures in Transition-Metal-Oxide Heterostructures* Alex Frano, 2014-05-28. This thesis presents the results of resonant and non resonant x-ray scattering experiments demonstrating the control of collective ordering phenomena in epitaxial nickel oxide and copper oxide based superlattices. Three outstanding results are reported: 1) LaNiO₃

LaAlO₃ superlattices with fewer than three consecutive NiO₂ layers exhibit a novel spiral spin density wave whereas superlattices with thicker nickel oxide layer stacks remain paramagnetic. The magnetic transition is thus determined by the dimensionality of the electron system. The polarization plane of the spin density wave can be tuned by epitaxial strain and spatial confinement of the conduction electrons.² Further experiments on the same system revealed an unusual structural phase transition controlled by the overall thickness of the superlattices. The transition between uniform and twin domain states is confined to the nickelate layers and leaves the aluminate layers unaffected.³ Superlattices based on the high temperature superconductor YBa₂Cu₃O₇ exhibit an incommensurate charge density wave order that is stabilized by heterointerfaces. These results suggest that interfaces can serve as a powerful tool to manipulate the interplay between spin order, charge order, and superconductivity in cuprates and other transition metal oxides.

Polymers and Electromagnetic Radiation Wolfram Schnabel, 2014-01-10. This first book to cover the interaction of polymers with radiation from the entire electromagnetic spectrum adopts a multidisciplinary approach to bridge polymer chemistry and physics, photochemistry, photophysics, and materials science. The text is equally unique in its scope, devoting equal amounts of attention to the three aspects of synthesis, characterization, and applications. The first part deals with the interaction of polymers with non-ionizing radiation in the frequency range from sub-terahertz via infrared radiation to visible and ultraviolet light, while the second covers interaction with ionizing radiation from the extreme ultraviolet to ray photons. The result is a systematic overview of how both types of radiation can be used for different polymerization approaches, spectroscopy methods, and lithography techniques. Authored by a world-renowned researcher and teacher with over 40 years of experience in the field, this is a highly practical and authoritative guide.
