**Analysis, Design and Construction of Steel Space Frames** G.S.

Ramaswamy, Mick Eekhout, G. R. Suresh, 2002 Space frames provide a lightweight solution to the problem of creating large span enclosures free from obstructions They are employed in many major construction projects across the world as documented in this authoritatively written volume This is the first in depth book to present all instances and applications of space frames in various engineering schemes It uses case studies and numerous illustrations to examine steel space frames from their design to their structural engineering performance Analysis Design and Construction of Steel Space Frames will be of particular use to practitioners through its use of various leading design codes including the Eurocodes Boasting an international authorship with wide experience in the research development and manufacture of space frames this book also draws contributions from leading practitioners and academics specialising in this area from across the globe

*Optimization of Gridshells Against Instability Considering Joints' Mechanical Performance* Mingfei Lu, Jihong Ye, Hui Li, 2025-08-10 This open access book introduces external factors such as loads and constraints into the theory of configurational vulnerability thereby overcoming the classical theory's inability to account for external influences Stability is

a governing factor in the design of single layer gridshells becoming increasingly critical as the span grows. However, current design methodologies address stability primarily through post design verification which severs the intrinsic link between member design and overall structural stability. This disjointed approach leads to iterative cycles of design and verification, reducing efficiency. Concurrently, advances in industrialized construction have spurred the development of numerous innovative joints tailored for prefabricated construction. These joints are neither ideally rigid nor ideally hinged. Yet prevailing design methods and stability verification processes still assume ideal rigid connections, failing to incorporate the mechanical properties of joints and thereby constraining the adoption and application of these new designs. This integration provides a novel perspective on instability mechanisms. Based on the instability mechanisms of gridshells, a stability optimization model is developed under the rigid joint assumption. Due to the large number of variables involved in the optimization model, conventional algorithms often prove inadequate. To address this, the study enhances the standard genetic algorithm by replacing its random mutation mechanism with a directed mutation mechanism, significantly improving search efficiency. The improved algorithm efficiently solves large scale stability optimization problems for single layer gridshells, as validated using three gridshells of varying scales and two constructed examples. To expand the forms of gridshell joints, the study employs advanced topology optimization techniques to enhance rotational stiffness. Simultaneously, the study integrates the requirements of prefabricated construction by designing a universal connection interface capable of accommodating members from diverse orientations. This effort culminates in the development of novel joint designs for spatial grid structures that are both mechanically efficient and construction friendly.

#### **Design of Steel Structures (Vol. 1)** Ramchandra,V.

Gehlot, 2016-01-01. Twelfth edition 2009 of this book is based on IS 800 2007 and also newly revised IS 883 1994 code of practice for timber structures. New code of practice IS 800 is likely to be issued soon. It is likely to introduce Limit State Design of Steel Structures. Authors have distributed the text in thirty four chapters in main text and one chapter on Location of Shear Centre in Appendix A. Concept of Shear Centre and bending axis is important and significant and essentially needed to understand simple theory of bending and so also unsymmetrical bending. Complete text has been updated and new matter added e.g. elastic buckling, inelastic stability and instability of columns and compression members, torsional buckling, torsional flexural buckling etc. Behaviour of web stiffeners and web panels, specially near the end panels, tension field action has been first time included to familiarise the students with the concept. Durability of steel members have been emphasized. Phenomenon of corrosion has been distinctly explained.

One of the main goals of a good and effective structural design is to decrease as far as possible the self weight of structures because they must carry the service load. This is especially important for reinforced concrete RC structures as the self weight of the material is substantial. For RC structures it is furthermore important that the w
