*Finite Element Simulation of External Ear Sound Fields for the Optimization of Eardrum-related Measurements* Sebastian Schmidt,2009 The sound pressure  $p_T$  at the human eardrum has essential advantages as reference signal in audiological and psychoacoustical experiments Unfortunately precise pressure measurements very close to the tympanic membrane are difficult In practice the microphone has to be positioned at a certain distance from the eardrum The measured pressure then has to be transformed to the eardrum As a classical approach for the estimation of the necessary transfer function an acoustical network model of the ear canal is developed from geometrical data of the canal cross sectional area function which is in turn determined from measurements of its acoustical input impedance Such methods however do not provide robust results In this thesis the concept of one dimensional models of the ear canal is examined to find the origin of these errors For this purpose the sound field at the human external ear was analyzed using finite element models Inside the canal irregular three dimensional structures occur that cannot be modelled accurately using classical one dimensional network concepts Upon these findings an accurate efficient and highly feasible method for the estimation of  $p_T$  was developed Equal loudness level contours with reference to the eardrum pressure that were measured as pilot application of the new method are presented
