

EVOLUTION OF STARS

After 10 billion years, the small star will run out of hydrogen and starts fusing helium, which causes the star to expand to a red giant

Planetary Nebula

After the star runs out of helium, the star will try to combine carbon, which the star can't combine. So the gas spreads apart from the star leaving behind a carbon dense white dwarf.

When the white dwarf runs out of its remaining energy, it loses its brightness and becomes a brown dwarf.

After the star explodes, the star can do two different things based on its size

1. It can form a very dense NEUTRON STAR
2. It can form the most densest object in the universe, a BLACK HOLE

Supernova

When a massive star runs out of hydrogen, it expands and will make all kind of elements until it starts forming Iron

When it has only iron left, gravity will collapse the star until it explodes from the pressure

Formation And Evolution Of Star Clusters:

The Formation and Evolution of Star Clusters Kenneth Janes, 1991 **The Formation and Evolution of Star Clusters** Simon Goodwin, Nate Bastian, 2013-09-01 In the past decade our picture of star and cluster formation has changed hugely we now believe that many if not most stars form in clusters and the process of star and cluster formation is extremely rapid and dynamic This book will provide an overview of our current understanding of the formation and evolution of star clusters This book will cover our understanding of how gas turns into stars and the structure and kinematics of very young star forming regions It will then describe how we think these young star forming regions evolve into clusters before destroying themselves It will also cover our understanding of young clusters in external galaxies especially starbursts and how these populations could evolve into globular cluster systems **On the Formation and Evolution of Stars and Star Clusters in the Milky Way** Michael J. Alexander, University of Wyoming. Department of Physics and Astronomy, 2012 Since the launch of the Spitzer Space Telescope the field of star formation SF has undergone a revolution as regions of our Galaxy once hidden have been revealed Large scale surveys have provided fodder on a myriad of topics both expected and unexpected The following work highlights my contributions to the fields of Galactic SF and cluster evolution My dissertation begins in Chapter 2 with the discovery of a massive star cluster containing more than a dozen red supergiant stars Based on the number of supergiants it is one of the largest star clusters in the Galaxy and it is now believed to be part of a burst of SF that created over 10^5 M subscript solar of stars in just a few Myr Chapter 3 is my paper on a very different type of star cluster which we termed ultracompact embedded clusters UCECs UCECs may represent a new class of heavily embedded M subscript gas 100 M subscript solar low stellar mass M Triggered Star Formation in a Turbulent Interstellar Medium (IAU S237) International Astronomical Union. Symposium, 2007-05-28 New stars form in the dense turbulent gas clouds of galaxies and the formation of these clouds is the subject of the IAU S237 This book is the most up to date review of all aspects of cloud and star formation and one of the few compendiums available on ISM turbulence **Formation and Evolution of Star Clusters and Their Host Galaxies** J. M. D. Kruijssen, 2011 Star Clusters (IAU S266) International Astronomical Union. Symposium, 2010-02-04 Star clusters are important to many areas of astronomy and as the basic building blocks of galaxies they can be used as key diagnostic tools within a wide range of disciplines in astrophysics Star cluster populations are powerful tracers of the formation assembly and evolutionary history of their parent galaxies Although their importance has been recognised for decades only in recent years has this area seen a major investment in time and effort IAU Symposium 266 consolidates the expertise of leading researchers from a variety of topical subfields in astrophysics to provide a comprehensive presentation of cutting edge developments in theory observations and simulations of star clusters and star cluster systems across a range of sizes and epochs This volume gives an account of this forefront research answering fundamental questions that will improve our understanding of numerous related issues and show how this field will take its

next major step forward The Formation and Evolution of Massive Young Star Clusters Henny J. G. L. M. Lamers, Linda J. Smith, Antonella Nota, 2004 Literature 1991, Part 2 Astronomisches Rechen-Institut, 2013-06-29 Astronomy and Astrophysics Abstracts appearing twice a year has become one of the fundamental publications in the fields of astronomy, astrophysics and neighbouring sciences. It is the most important English language abstracting journal in the mentioned branches. The abstracts are classified under more than a hundred subject categories, thus permitting a quick survey of the whole extended material. The AAA is a valuable and important publication for all students and scientists working in the fields of astronomy and related sciences. As such, it represents a necessary ingredient of any astronomical library all over the world.

Formation and Evolution of Star Clusters in Interacting Galaxies Peter Anders, 2006 *Dynamics of Young Star Clusters and Associations* Cathie Clarke, Robert D. Mathieu, Iain Neill Reid, 2015-09-11 Where do most stars and the planetary systems that surround them in the Milky Way form? What determines whether a young star cluster remains bound, such as an open or globular cluster, or disperses to join the field stars in the disc of the Galaxy? These questions not only impact understanding of the origins of stars and planetary systems like our own and the potential for life to emerge, but also galaxy formation and evolution and ultimately the story of star formation over cosmic time in the Universe. This volume will help readers understand our current views concerning the answers to these questions, as well as frame new questions that will be answered by the European Space Agency's Gaia satellite that was launched in late 2013. The book contains the elaborated notes of lectures given at the 42nd Saas Fee Advanced Course Dynamics of Young Star Clusters Associations by Cathie Clarke (University of Cambridge) who presents the theory of star formation and dynamical evolution of stellar systems; Robert Mathieu (University of Wisconsin) who discusses the kinematics of star clusters and associations; and I. Neill Reid (Space Telescope Science Institute) who provides an overview of the stellar populations in the Milky Way and speculates on from whence came the Sun. As part of the Saas Fee Advanced Course Series, the book offers an in-depth introduction to the field, serving as a starting point for Ph.D. research and as a reference work for professional astrophysicists.

Evolution of Stars and Stellar Populations Maurizio Salaris, Santi Cassisi, 2005-12-13 Evolution of Stars and Stellar Populations is a comprehensive presentation of the theory of stellar evolution and its application to the study of stellar populations in galaxies. Taking a unique approach to the subject, this self-contained text introduces first the theory of stellar evolution in a clear and accessible manner, with particular emphasis placed on explaining the evolution with time of observable stellar properties such as luminosities and surface chemical abundances. This is followed by a detailed presentation and discussion of a broad range of related techniques that are widely applied by researchers in the field to investigate the formation and evolution of galaxies. This book will be invaluable for undergraduates and graduate students in astronomy and astrophysics and will also be of interest to researchers working in the field of Galactic, extragalactic astronomy and cosmology. Comprehensive presentation of stellar evolution theory introduces the concept of stellar population and describes stellar population synthesis.

methods to study ages and star formation histories of star clusters and galaxies presents stellar evolution as a tool for investigating the evolution of galaxies and of the universe in general

Formation and Early Evolution of Stellar Clusters Joshua E. Wall, 2019 We describe a novel numerical method for the studying the formation and evolution of stellar clusters Torch This method combines the magnetohydrodynamics code Flash with the Astrophysical Multipurpose Software Environment AMUSE Once embedded into AMUSE we combine Flash with the stellar evolution code SeBa the N body dynamics code ph4 and the multiple star system evolution module multiples to create a unique method for tracing the detailed evolution of stellar clusters through time We then add units for radiation stellar winds and supernovae as well as a new star by star formation prescription to Flash that allows for star formation and stellar feedback to create and destroy star clusters and the interstellar gas they form from The result is the most detailed star cluster formation code to date We then demonstrate the use of these methods for studying binary star formation and the effects of stellar feedback We find that massive dynamical binaries created in our simulations are consistent with observations Further we observe that wide dynamical binaries tighten due to gas dynamical friction losing cluster energy to the natal gas after which they are disrupted by stellar encounters This supports theoretical predictions that embedded clusters may contract due to the interactions of gas and stars We also find that while stellar feedback is effective at expelling gas from natal clusters the clusters themselves remain bound even as they expand due to the loss of the binding potential of the gas Finally stellar clusters formed in our simulations mass segregate before the expulsion of their natal gas clouds as expected from observations of young clusters in the Milky Way

Globular Clusters - Guides to Galaxies Tom Richtler, Søren Larsen, 2008-11-23 The principal question of whether and how globular clusters can contribute to a better understanding of galaxy formation and evolution is perhaps the main driving force behind the overall endeavour of studying globular cluster systems Naturally this splits up into many individual problems The objective of the Joint ESO FONDAP Workshop on Globular Clusters Guides to Galaxies was to bring together researchers both observational and theoretical to present and discuss the most recent results Topics covered in these proceedings are internal dynamics of globular clusters and interaction with host galaxies tidal tails evolution of cluster masses accretion of globular clusters detailed descriptions of nearby cluster systems ultracompact dwarfs formations of massive clusters in mergers and elsewhere the ACS Virgo survey galaxy formation and globular clusters dynamics and kinematics of globular cluster systems and dark matter related problems With its wide coverage of the topic this book constitutes a valuable reference of the scientific knowledge of the field

Multi-scale Approach of the Formation and Evolution of Star Clusters Julien Dorval, 2016 Young star clusters are substructured and undergo a dynamical evolution erasing this substructure to form relaxed spherical clusters I present a new method to generate realistic initial conditions to perform N body simulations of this process the Hubble Lemaitre fragmentation By expanding an initially uniform sphere I allow spontaneous overdensities to grow creating a realistic model for young clumpy stellar systems This method is validated

by analysing the distribution and content of the clumps and comparing them to hydrodynamical simulations of star formation as well as observations of star forming regions These systems undergo a softer collapse than uniform ones I injected binary stars in the fragmented models and found they were heavily processed when substructure was present I also found extreme short and tight binaries down to 0.01 AU to form in the models The method has a lot of potential such as the generation of mock observations of star forming regions

The Birth of Star Clusters Steven Stahler, 2017-11-04 All stars are born in groups The origin of these groups has long been a key question in astronomy one that interests researchers in star formation the interstellar medium and cosmology This volume summarizes current progress in the field and includes contributions from both theorists and observers Star clusters appear with a wide range of properties and are born in a variety of physical conditions Yet the key question remains How do diffuse clouds of gas condense into the collections of luminous objects we call stars This book will benefit graduate students newcomers to the field and also experienced scientists seeking a convenient reference

About Stars: Their Formation, Evolution, Compositions, Locations And Companions

Michael Mark Woolfson, 2019-07-24 Each chapter ends with up to six student problems There is full set of worked answers at the end of the book but modern students might not be enlightened by the samples of Fortran code probably meant to illustrate how realistic calculations might be made

Contemporary Physics On a clear and moonless night especially in remote areas such as deserts myriads of points of light cover the sky The great majority of them are stars many like the Sun but so far away that they can only be seen as point sources of light The problem faced by astronomers is to find their properties and distances just from the light they emit This is done by using the knowledge of science mainly physics acquired from small scale experiments carried out on Earth However the stars themselves are laboratories in which matter behaves in ways that cannot be reproduced on Earth so in finding out about stars we complement scientific knowledge gained from earthbound experimentation This book describes the means some very ingenious by which to explore the properties locations and planetary companions of stars and provides a sound foundation for further study
