presents a conceptual overview of GCA and the core analysis syntax using the lme4 package and demonstrates how to plot model fits The book describes how to deal with change over time that is not linear how to structure random effects how GCA and regression use categorical predictors and how to conduct multiple simultaneous comparisons among different levels of a factor It also compares the advantages and disadvantages of approaches to implementing logistic and quasi logistic GCA and discusses how to use GCA to analyze individual differences as both fixed and random effects The final chapter presents the code for all of the key examples along with samples demonstrating how to report GCA results Throughout the book R code illustrates how to implement the analyses and generate the graphs Each chapter ends with exercises to test your understanding The example datasets code for solutions to the exercises and supplemental code and examples are available on the author s website   **A Mathematical and Philosophical Dictionary** Charles Hutton,1795   **Ontological Investigations** Ingvar Johansson,2013-05-02 This volume is devoted to problems within analytic metaphysics It defends an ontology and theory of categories inspired by Aristotle but revised in such a way as to be compatible with modern science The ontology of both natural and social reality is addressed starting out from the view that universals exist but only in the spatiotemporal world immanent realism In attempting to bring Aristotle s ontology up to date the author relies very much on the thinking of Edmund Husserl conceiving the cement of the universe as Husserlian relations of existential dependence and regarding intentionality as a non reducible category in the ontology of mind The work is thoroughly realistic in spirit but large parts of it should nonetheless be of interest to conceptualists and nominalists too
