Where:

- u = parameter [0.0 – 1.0]
- $C(u)$ = curve evaluated at u
- $N_{i,p}$ = i_{th} basis function of degree p
- P_i = i_{th} control point

Mathematical Analysis, Wavelets, and Signal Processing Mourad Ismail, 1995 This book contains the proceedings of an international conference held in Cairo Egypt January 1994 Mathematics and engineering discoveries such as wavelets multiresolution analysis and subband coding schemes caused rapid advancements in signal processing necessitating an interdisciplinary approach Contributors to this conference demonstrated that some traditional areas of mathematical analysis sampling theory approximation theory and orthogonal polynomials have proven extremely useful in solving various signal processing problems *Anniversary Volume on Approximation Theory and Functional Analysis* P. L. Butzer, R. L. Stens, B. Sz. Nagy, 2013-11-21 These Proceedings include 42 of the 49 invited conference papers three papers submitted subsequently and a report devoted to new and unsolved problems based on two special problem sessions and as augmented by later communications from the participants In addition there are four short accounts that emphasize the personality of the scholars to whom the proceedings are dedicated Due to the large number of contributors the length of the papers had to be restricted This volume is again devoted to recent significant results obtained in approximation theory harmonic analysis functional analysis and operator theory The papers solicited include in addition survey articles that not only describe fundamental advances in their subfields but many also emphasize basic interconnections between the various research areas They tend to reflect the range of interests of the organizers and of their immediate colleagues and collaborators The papers have been grouped according to subject matter into ten chapters Chapter I on operator theory is devoted to certain classes of operators such as contraction hyponormal and accretive operators as well as to suboperators and semi groups of operators Chapter II on functional analysis contains papers on function spaces algebras ideals and generalized functions Chapter III on abstract approximation is concerned with the comparison of approximation processes the gliding hump method certain interpolation spaces and n widths *Functional Analysis in Interdisciplinary Applications* Tynysbek Sh. Functional Analysis and Numerical Mathematics Lothar Collatz, 2014-05-12 Functional Analysis and Numerical Mathematics focuses on the structural changes which numerical analysis has undergone including iterative methods vectors integral equations matrices and boundary value problems The publication first examines the foundations of functional analysis and applications including various types of spaces convergence and completeness operators in Hilbert spaces vector and matrix norms eigenvalue problems and operators in pseudometric and other special spaces The text then elaborates on iterative methods Topics include the fixed point theorem for a general iterative method in pseudometric spaces special cases of the fixed point theorem and change of operator iterative methods for differential and integral equations and systems of equations and difference methods The manuscript takes a look at monotonicity inequalities and other topics including monotone operators applications of Schauder's theorem matrices and boundary value problems of monotone kind discrete Chebyshev approximation and exchange methods and approximation of functions The publication is a valuable source of data for mathematicians and researchers interested in functional analysis and numerical mathematics

Nonlinear Integral Operators and Applications Carlo Bardaro, Julian Musielak, Gianluca Vinti, 2008-08-22 In 1903 Fredholm published his famous paper on integral equations Since then linear integral operators have become an important tool in many areas including the theory of Fourier series and Fourier integrals approximation theory and summability theory and the theory of integral and differential equations As regards the latter applications were soon extended beyond linear operators In approximation theory however applications were limited to linear operators mainly by the fact that the notion of singularity of an integral operator was closely connected with its linearity This book represents the first attempt at a comprehensive treatment of approximation theory by means of nonlinear integral operators in function spaces In particular the fundamental notions of approximate identity for kernels of nonlinear operators and a general concept of modulus of continuity are developed in order to obtain consistent approximation results Applications to nonlinear summability nonlinear integral equations and nonlinear sampling theory are given In particular the study of nonlinear sampling operators is important since the results permit the reconstruction of several classes of signals In a wider context the material of this book represents a starting point for new areas of research in nonlinear analysis For this reason the text is written in a style accessible not only to researchers but to advanced students as well

Exploring Mathematical Analysis, Approximation Theory, and Optimization Nicholas J. Daras, Michael Th. Rassias, Nikolaos B. Zographopoulos, 2024-01-04 This book compiles research and

A Course in Approximation Theory Elliott Ward Cheney,William Allan Light,2009-01-13 This textbook is designed for graduate students in mathematics physics engineering and computer science Its purpose is to guide the reader in exploring contemporary approximation theory The emphasis is on multi variable approximation theory i e the approximation of functions in several variables as opposed to the classical theory of functions in one variable Most of the topics in the book heretofore accessible only through research papers are treated here from the basics to the currently active research often motivated by practical problems arising in diverse applications such as science engineering geophysics and business and economics Among these topics are projections interpolation paradigms positive definite functions interpolation theorems of Schoenberg and Micchelli tomography artificial neural networks wavelets thin plate splines box splines ridge functions and

convolutions An important and valuable feature of the book is the bibliography of almost 600 items directing the reader to important books and research papers There are 438 problems and exercises scattered through the book allowing the student reader to get a better understanding of the subject

Advanced Topics in Shannon Sampling and Interpolation Theory Robert J. Marks, 2012-12-06 Advanced Topics in Shannon Sampling and Interpolation Theory is the second volume of a textbook on signal analysis solely devoted to the topic of sampling and restoration of continuous time signals and images Sampling and reconstruction are fundamental problems in any field that deals with real time signals or images including communication engineering image processing seismology speech recognition and digital signal processing This second volume includes contributions from leading researchers in the field on such topics as Gabor's signal expansion sampling in optical image formation linear prediction theory polar and spiral sampling theory interpolation from nonuniform samples an extension of Papoulis's generalized sampling expansion to higher dimensions and applications of sampling theory to optics and to time frequency representations The exhaustive bibliography on Shannon sampling theory will make this an invaluable research tool as well as an excellent text for students planning further research in the field

Function Spaces and Applications Michael Cwikel, Jaak Peetre, Yoram Sagher, Hans E. Wallin, 2006-11-15 This seminar is a loose continuation of two previous conferences held in Lund 1982 1983 mainly devoted to interpolation spaces which resulted in the publication of the Lecture Notes in Mathematics Vol 1070 This explains the bias towards that subject The idea this time was however to bring together mathematicians also from other related areas of analysis To emphasize the historical roots of the subject the collection is preceded by a lecture on the life of Marcel Riesz

Theory of Function Spaces Hans Triebel, 2010-06-16 The book deals with the two scales $B_{p,q}^s$ and $F_{p,q}^s$ of spaces of distributions where s and $0 < p < q$ which include many classical and modern spaces such as Hölder spaces Zygmund classes Sobolev spaces Besov spaces Bessel potential spaces Hardy spaces and spaces of BMO type It is the main aim of this book to give a unified treatment of the corresponding spaces on the Euclidean n space \mathbb{R}^n

Best Approximation by Linear Superpositions (approximate Nomography) S. Ā. Khavinson, 1997-01-01 This book deals with problems of approximation of continuous or bounded functions of several variables by linear superposition of functions that are from the same class and have fewer variables The main topic is the space of linear superpositions D considered as a sub space of the space of continuous functions $C(X)$ on a compact space X Such properties as density of D in $C(X)$ its closedness proximality etc are studied in great detail The approach to these and other problems based on duality and the Hahn Banach theorem is emphasized Also considerable attention is given to the discussion of the Diliberto Straus algorithm for finding the best approximation of a given function by linear superpositions

The Finite Element Method for Elliptic Problems Philippe G. Ciarlet, 2002-04-01 This is the only book available that fully analyzes the mathematical foundations of the finite element method Not only is it valuable reference and introduction to current research it is also a working textbook for graduate
