Flight of Mammals: From Terrestrial Limbs to Wings Aleksandra A. Panyutina, Leonid P. Korzun, Alexander N. Kuznetsov, 2015-03-13 This book offers a new explanation for the development of flight in mammals and offers detailed morphological descriptions of mammals with flapping flight The skeletomuscular apparatus of the shoulder girdle and forelimbs of tree shrews flying lemurs and bats is described in detail Special attention is paid to the recognition of peculiar features of the skeleton and joints For the basic locomotor patterns of flying lemurs and bats the kinematic models of the shoulder girdle elements are developed The most important locomotor postures of these animals are analyzed by means of statics The key structural characters of the shoulder girdle and forelimbs of flying lemurs and bats the formation of which provided transition of mammals from terrestrial locomotion to gliding and then to flapping flight are recognized The concept is proposed that preadaptations preceding the acquisition of flapping flight could have come from widely sprawled forelimb posture while gliding from tree to tree and running up the thick trunks It is shown that flying lemur is an adequate morphofunctional model for an ancestral stage of bats The evolutionary ecomorphological scenario describing probable transformational stages of typical parasagittal limbs of chiropteran ancestors into wings is developed

Ecology of Bats T.H. Kunz, 2013-11-11 Among living vertebrates bats and birds are unique in their ability to fly

and it is this common feature that sets them apart ecologically from other groups. Bats are in some ways the nocturnal equivalents of birds having evolved and radiated into a diversity of forms to fill many of the same niches. The evolution of flight and echolocation in bats was undoubtedly a prime mover in the diversification of feeding and roosting habits, reproductive strategies and social behaviors. Bats have successfully colonized almost every continental region on earth except Antarctica as well as many oceanic islands and archipelagos. They comprise the second largest order of mammals next to rodents in number of species and probably exceed all other such groups in overall abundance. Bats exhibit a dietary diversity including insects, fruits, leaves, flowers, nectar and pollen, fish, other vertebrates and blood, unparalleled among other living mammals. Their reproductive patterns range from seasonal monestry to polyestry and mating systems include promiscuity, monogamy and polygyny. The vast majority of what we know about the ecology of bats is derived from studies of only a few of the approximately 850 species, yet in the past two decades studies on bats have escalated to a level where many important empirical patterns and processes have been identified. This knowledge has strengthened our understanding of ecological relationships and encouraged hypothesis testing rather than perpetuated a catalog of miscellaneous observations.
