Fault Diagnosis Józef Korbicz, Jan M. Koscielny, Zdzisław Kowalczyk, Wojciech Cholewa, 2012-12-06 All real systems in nature physical biological and engineering ones can malfunction and fail due to faults in their components Logically the chances for malfunctions increase with the systems complexity The complexity of engineering systems is permanently growing due to their growing size and the degree of automation and accordingly increasing is the danger of failing and aggravating their impact for man and the environment Therefore in the design and operation of engineering systems increased attention has to be paid to reliability safety and fault tolerance But it is obvious that compared to the high standard of perfection that nature has achieved with its self healing and self repairing capabilities in complex biological organisms fault management in engineering systems is far behind the standards of their technological achievements it is still in its infancy and tremendous work is left to be done In technical control systems defects may happen in sensors actuators

components of the controlled object the plant or in the hardware or software of the control framework Such defects in the components may develop into a failure of the whole system This effect can easily be amplified by the closed loop but the closed loop may also hide an incipient fault from being observed until a situation has occurred in which the failing of the whole system has become unavoidable

Machine Learning in Medical Diagnosis Leslye Denisse Dias Duran, 2025-06-09

This book seeks to navigate between the optimism that has arisen from the promise of the potential of machine learning ML in healthcare and the lack of clarity about what realistic risks and benefits we can foresee. Its main aim is to develop a relational rights based normative approach to evaluating the distribution of burdens and benefits of implementing ML in medical diagnosis. This framework, called the Ecosystem of Moral Constellations, assumes that every person has an equal claim to the fundamental rights necessary to lead one's life but recognizes that there may be conflicting interests that risk violating or infringing the rights of an individual or individuals and that therefore an assessment of these tensions requires a situational prioritization of certain rights over others. This framework proposes to consider the normative relevance of relationships at different points of moral engagement to assess the potential tensions between these burdens and benefits of these technologies. The author argues that decisions about the implementation of AI systems require more than an assessment of technical feasibility. Instead, it is imperative to consider the different normative goals and interests of the actors involved, the material capabilities of the tools, and the role they should play in the clinical workflow. **MICAI 2002:**
