

# Functional form of operators

- All operators have a functional form
- For example, an expression using the addition operator such as  $2 + 5$  can be written instead using the function **plus**, and passing 2 and 5 as the arguments:

```
>> plus(2,5)
```

```
ans =
```

```
7

**Linear Functional Equations. Operator Approach** Anatolij Antonevich, 2012-12-06 In this book we shall study linear functional equations of the form  $m \sum_{k=1}^n U_k(x) f_k(x)$  where  $U$  is an unknown function from a given space  $F(X)$  of functions on a set  $X$   $Q_k: X \rightarrow X$  are given mappings  $a_k$  and  $f$  are given functions Our approach is based on the investigation of the operators given by the left hand side of equation 1 In what follows such operators will be called functional operators We will pay special attention to the spectral properties of functional operators first of all to invertibility and the Noether property Since the set  $X$  the space  $F(X)$  the mappings  $Q_k$  and the coefficients  $a_k$  are arbitrary the class of operators of the form 1 is very rich and some of its individual representatives are related with problems arising in various areas of mathematics and its applications In addition to the classical theory of functional equations among such areas one can indicate the theory of functional differential equations with deviating argument the theory of nonlocal problems for partial differential equations the theory of boundary value problems for the equation of a vibrating string and equations of mixed type a number of problems of the general theory of operator algebras and the theory of dynamical systems the spectral theory of automorphisms of Banach algebras and other problems

Functional Differential Operators and Equations U.G. Kurbatov, 1999-04-30 This book deals with linear functional differential equations and operator theory methods for their investigation The main topics are the equivalence of the input output stability of the equation  $Lx$  and the invertibility of the operator  $L$  in the class of casual operators the equivalence of input output and exponential stability the equivalence of the dichotomy of solutions for the homogeneous equation  $Lx = 0$  and the invertibility of the operator  $L$  the properties of Green's

function the independence of the stability of an equation from the norm on the space of solutions shift invariant functional differential equations in Banach space the possibility of the reduction of an equation of neutral type to an equation of retarded type special full subalgebras of integral and difference operators and operators with unbounded memory and the analogue of Fredholm's alternative for operators with almost periodic coefficients where one sided invertibility implies two sided invertibility Audience This monograph will be of interest to students and researchers working in functional differential equations and operator theory and is recommended for graduate level courses
