Genetics And The Extinction Of Species Dna And The Conservation Of Biodiversity:

Genetics and the Extinction of Species Laura Landweber, Andrew Dobson, 1999-07-21 In this collection a team of leading biologists demonstrates why the burgeoning field of conservation biology must continue to rely on the insights of population genetics if we are to preserve the diversity of living species

Genetics and the Extinction of Species Laura Faye Landweber, Andrew P. Dobson, 1999 Darwin's Origin of Species and Dobzhansky's Genetics and the Origin of Species have been the cornerstones of modern evolutionary and population genetic theory for the past hundred years but in the twenty first century biologists will face graver problems of extinction In this collection a team of leading biologists demonstrates why the burgeoning field of conservation biology must continue to rely on the insights of population genetics if we are to preserve the diversity of living species Technological and theoretical developments throughout the 1990s have allowed for important new insights into how populations have evolved in response to past selection pressures while providing a broad new understanding of the genetic structure of natural populations The authors explore these advances and argue for the applicability of new genetic methods in conservation biology The volume covers such topics as the reasons for extinctions the best ways to measure biodiversity and the benefits and drawbacks of policies like captive breeding Genetics and the Extinction of Species is a rich source of information for biologists and policymakers who want to learn more about the host of tools theories and approaches available for conserving biodiversity In addition to the editors the contributors to the volume are William Amos Rebecca Cann Kathryn Rodriguez Clark Leslie Douglas Leonard Freed Paul Harvey Kent Holsinger Russell Lande and Helen Steers

Recent Advances in Plant Biotechnology and Its Applications Ashwani Kumar, Sudhir K. Sopory, 2008 This book is divided into five sections The first section deals with the methodology and bioresource generation techniques related to genetic engineering and gene transfer to the nuclear genome and chloroplast genome The new techniques of genome profiling and gene silencing are also presented The second section of the book covers the classical aspect of plant biotechnology viz tissue culture and micropropagation Use of genetic engineering via Agrobacterium and direct transfer of DNA through particle bombardment to develop transformed plants in Artemisia castor and orchids and production of recombinant proteins in plant cells have been dealt with in the third section The fourth section addresses the abiotic and biotic stress tolerance in plants The basic biology of some of the stress responses and designing plants for stress tolerance is discussed in this section The fifth section examines medicinal plants and alkaloid production
