Structure of the earth

Earth's core

The Earth's core is the innermost and hottest center of our planet. It begins at a depth of around 2,900 kilometers (1,800 miles) from the surface. The solid inner core and the liquid outer core. Temperature is up to 5,000 degrees Celsius (9,000 degrees Fahrenheit) in the inner core.

The Earth's core creates mostly of molten metal. Its movement creates the Earth's magnetic field which protects us from dangerous radiation from space. Without the Earth's core, life on Earth would hardly be possible.

Discover the Earth's core lies as deep, it would be almost directly

Earth's crust

The Earth's crust is the outermost layer of our planet. Compared to the Earth's mantle and core, it is very thin - around 10 to 70 kilometers (6 to 43 miles) thick. All humans, animals and plants live on it.

The crust consists of solid rocks that flow under the intense heat under the mantle. The mantle's movement causes all life on Earth. Mountains, lakes and volcanoes are also found in the

Plate tectonics

The Earth's crust consists of several large plates floating on the molten mantle. These plates move slowly but constantly. This movement is called plate tectonics.

When two plates collide, earthquakes, volcanoes or mountains can form. In other places, they drift apart and new material is formed. Particularly active areas are called plate boundaries.

The theory of plate tectonics was only discovered in the 20th century. It explains many processes on Earth, for example why volcanoes often lie on the edge of plates. The earth is constantly changing - due to forces deep inside.

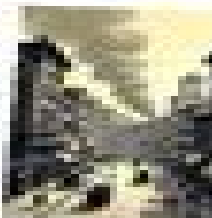

Earthquakes

Earthquakes occur when the Earth's plates shift against each other. This creates up to several meters of displacement. This is a force that spreads through the ground in waves.

Earthquakes can be felt on the surface in some places. In California, the San Andreas Fault is a famous example. Other in California are the San Jacinto Fault and the San Gabriel Fault.

Earthquakes can be recorded using measuring devices known as seismographs. The strength is measured on the Richter scale. In some cases, a magnitude of 9 can cause damage. Early warning systems are important.

Volcanoes

Volcanoes are formed where magma from the Earth's interior reaches the surface. If the pressure becomes too great, the magma erupts and flows from the volcano into the air. Some volcanoes are dormant for a long time, others are very active.

There are over 1,500 active volcanoes worldwide, many of them along the Pacific. There have been particularly well-known eruptions in Italy, Iceland and Indonesia. Volcanoes can destroy villages, but they can also create fertile soil.

With eruptions, the landscape and climate can change a lot.

Rocks

In the Earth's crust, there are three main types of rocks: igneous rocks from cooled magma, sedimentary rocks from sand and mud, and metamorphic rocks from pressure and heat.

Some rocks are formed by magma, for example in the form of lava. Others are formed by sedimentation or by heat and pressure. These processes can take years.

Important are metamorphic rocks. They are used for building materials. Through research, we learn a lot about
