Geometric Theory Of Conjugate Tooth Surfaces:

A Geometric Theory Of Conjugate Tooth Surfaces Jia-shun Luo, Da-ren Wu, 1992-05-14 This English translation with revisions of the well known Chinese edition presents systematically the geometric theory of conjugate tooth surfaces in a more or less rigorous form The concepts of the two kinds of limit points and limit curves are explained in some detail and a general formula for induced normal curvature is derived of which the formula of Euler Savary appears as a direct consequence The idea of relative differentiation initiated by Zhida Yan simplifies the presentation considerably The phenomenon of secondary contact closely related to the limit curve of the second kind is treated in full and its applications to direct and indirect generation are explained concrete formulas for secondary plane envelope are derived Kinematic Geometry of Gearing David B. Dooner, 2012-04-09 Building on the first edition published in 1995 this new edition of Kinematic Geometry of Gearing has been extensively revised and updated with new and original material This includes the methodology for general tooth forms radius of torsure cylinder of osculation and cylindroid of torsure the author has also completely reworked the 3 laws of gearing the first law re written to better parallel the existing Law of Gearing as pioneered by Leonard Euler expanded from Euler's original law to encompass non circular gears and hypoid gears the 2nd law of gearing describing a unique relation between gear sizes and the 3rd law completely reworked from its original form to uniquely describe a limiting condition on curvature between gear teeth with new relations for gear efficiency are presented based on the kinematics of general toothed wheels in mesh There is also a completely new chapter on gear vibration load factor and impact Progressing from the fundamentals of geometry to construction of gear geometry and application Kinematic Geometry of Gearing presents a generalized approach for the integrated design and manufacture of gear pairs cams and all other types of toothed motion force transmission mechanisms using computer implementation based on algebraic geometry **The Kinematic Geometry of Gearing** David B. Dooner, Ali Seireg, 1995 Describing a dynamic new approach to the design manufacture and evaluation of gears The Kinematic Geometry of Gearing is an indispensable tool of the trade for gear and power transmission engineers and tribologists It presents an entirely new and comprehensive methodology for the design and manufacture of virtually all types of toothed bodies for general function transmission The authors develop from first principles the kinematic relationships necessary to design and manufacture circular and non circular gears and other contact type motion force transmission mechanisms They also demonstrate with the help of the enclosed software how the user specifications can be implemented in an interactive PC environment such that gear pairs and cutter pairs can be designed concurrently The revolutionary approach outlined by Professors Dooner and Seireg is based on mathematical derivations from various theories of kinematic geometry especially the screw theory This approach arms engineers and tribologists with a powerful new tool for enhancing the performance of conventional gears mounted on parallel or non parallel axes Furthermore it has been proven capable of greatly facilitating the design and manufacture of new

devices revealing heretofore unexplained phenomena which currently hinder the advancement of the gearing art beyond application to constant speed transmission It also provides a means of developing and manufacturing tools and gear forms which were previously difficult to conceptualize or implement The Kinematic Geometry of Gearing is divided into three sections with the first being devoted to introducing the basic concepts and various types of toothed motion force transmission mechanisms Part II builds upon those concepts to develop a comprehensive methodology that can be applied to the design and manufacture of various types of gears and motion function generators Part III discusses the design procedure itself The authors supply a number of simplified design formulas and with the help of numerous examples they clearly illustrate the capabilities of this versatile new approach to the integrated interactive CAD CAM of gear pairs and their production process This groundbreaking book presents an entirely new and comprehensive methodology for the design manufacture and evaluation of gears and virtually all other types of toothed motion force transmission mechanisms In it the authors develop the kinematic relationships necessary to design and manufacture gear pairs and with the help of the enclosed software demonstrate how those relationships can utilize the design specification in an interactive PC environment to produce the design and manufacturing information and performance characteristics concurrently A powerful new tool for evaluating and enhancing the performance of gear pairs and dealing with previously unexplained phenomena An evolutionary leap in the design and manufacture of gear pairs provides a method for developing and manufacturing tools and gear forms which were previously difficult to conceptualize or implement Design formulas and numerous real world examples clearly illustrate the capabilities of this versatile new approach Enclosed disk demonstrates to designers how to implement the described method into a fully integrated CAD and CAM process *Theory of Gearing* Stephen P.
