The Fourth Dimension and Non-Euclidean Geometry in Modern Art, revised edition Linda Dalrymple  
Henderson, 2018-05-18 The long awaited new edition of a groundbreaking work on the impact of alternative concepts of space on modern art In this groundbreaking study first published in 1983 and unavailable for over a decade Linda Dalrymple Henderson demonstrates that two concepts of space beyond immediate perception the curved spaces of non Euclidean geometry and most important a higher fourth dimension of space were central to the development of modern art The possibility of a spatial fourth dimension suggested that our world might be merely a shadow or section of a higher dimensional existence That iconoclastic idea encouraged radical innovation by a variety of early twentieth century artists ranging from French Cubists Italian Futurists and Marcel Duchamp to Max Weber Kazimir Malevich and the artists of De Stijl and Surrealism In an extensive new Reintroduction Henderson surveys the impact of interest in higher dimensions of space in art and culture from the 1950s to 2000 Although largely eclipsed by relativity theory beginning in the 1920s the spatial fourth dimension experienced a resurgence during the later 1950s and 1960s In a remarkable turn of events it has returned as an important theme in contemporary culture in the wake of the emergence in the 1980s of both string theory in physics with its ten or eleven dimensional universes and computer graphics Henderson demonstrates the importance of this new conception of space for figures ranging from Buckminster Fuller Robert Smithson and the Park Place Gallery group in the 1960s to Tony Robbin and digital architect Marcos Novak      Connections Between Mathematics, the Arts and

Architecture Nicoletta Sala, Gabriele Cappellato, 2019 The purpose of this book is to analyze the interdisciplinary aspects of mathematics and geometry in reference to nature art and architecture In Chapter 1 we introduce symmetry and its different meanings Symmetry is a notion which has been applied in the arts and architecture to find harmony and beauty It joins aesthetics and practice science and economy mathematics and philosophy In this chapter we also analyze the influence of Vitruvius and the concept of old symmetry received by the Renaissance It is also interesting to note how in contemporary architecture there is often the presence of the break of symmetry for example in the Frank O Gehry s works Chapter 2 explains how proportions and in particular the golden section has introduced aesthetic canons that have strongly influenced many artists like Polycletus and architects from Ictinus to Le Corbusier In Chapter 3 we discover how curves and spirals find their application in artistic works for example in Mycenaean jewelry and architectural works from the Baroque of Francesco Borromini to the Land Art of Smithson Chapter 4 presents the importance and influence that Platonic solids and polyhedrons have had on philosophy and art through different historical periods and different cultures For instance we look at how Platonic solids are connected to the theory of Empedocles elements and Hippocrates theory of humors Chapter 5 describes surfaces discovering how different cultures have used them in different manners including Roman aqueducts iron bridges and finally arriving on modern structures that base their forms on hyperboloids and paraboloids In Chapter 6 we introduce fractal geometry as a geometry that tries to explain nature s irregular shapes trying to overcome the limitations imposed by old Euclidean geometry We also analyze how fractal geometry has influenced architecture in this century

Beyond Geometry Lynn Zelevansky, 2004

*A New Sacred Geometry* Seth T. Miller, 2013-01-01 This book is a visually compelling journey through the unique geometric discoveries of Frank Chester a contemporary sacred geometer artist and sculptor This art style book with highly polished design elements leads the reader from discovery to discovery complemented by original text from the author a PhD who has studied Frank s work from its inception when it was just seven sticks in a ball of mud on the banks of the American River From the back cover The ancient tradition of Sacred Geometry is still alive and well in the person of Frank Chester He has discovered a new geometric form that unites the five Platonic solids and provides some startling indications about the form and function of the human heart This new form called the Chestahedron was discovered in 2000 and is a seven sided polyhedron with surfaces of equal area Frank has been exploring the form and its significance for over a decade His work has potential implications across a number of areas from physiology to architecture sculpture geology and beyond Inspired by the work of Rudolf Steiner Frank sees a deep connection between form and spirit This book gives a brief highly visual overview of some of Frank s discoveries and presents a compelling series of indications for future research

The Fourth Dimension and Non-Euclidean Geometry in Modern Art Linda D. Henderson, *The Polyhedrists* Noam Andrews, 2022-05-03 A history of the relationship between art and geometry in the early modern period In *The Polyhedrists* Noam Andrews unfolds a history of the relationship between art and geometry in early modern Europe told

largely through a collective of ground breaking artisan artists among them Luca Pacioli Albrecht Dürer Wenzel Jamnitzer and Lorentz Sterner and by detailed analysis of a rich visual panoply of their work featuring paintings prints decorative arts cabinetry and lavishly illustrated treatises But this is also an art history of the polyhedra themselves emblems of an evolving artistic intelligence which include a varied set of geometrical figures both Platonic or regular like the simple tetrahedron and Archimedean or irregular like the complex yet beguiling rhombicuboctahedron Moreover The Polyhedrists argues that the geometrical depictions of Dürer Jamnitzer et al were far more than mere follies from the dawn of perspective at odds with a contemporary view of the Renaissance and destined to be superseded by later developments in higher level mathematics In fact the evolution of the solids into innumerable irregular bodies constituted a sustained moment in the formulation of Renaissance mathematical knowledge and its engagement with materiality This intense field of experimentation would birth a new language of geometrical abstraction that would ignite a century of novel form making strategies ultimately paving the way for developments in geometry and topology in the nineteenth and early twentieth centuries and even prefiguring the more recent digital turn The book in this sense is not just an applied history of geometry nor a particular geometric reading of early modern art through some of its more celebrated practitioners but a manifesto of sorts into the hitherto unexplored wilds of art and science

Construction and Geometry in Painting Galerie Chalette, 1960      **Shaping Space** Marjorie Senechal, 2013-03-22 This second edition is based off of the very popular Shaping Space A Polyhedral Approach first published twenty years ago The book is expanded and updated to include new developments including the revolutions in visualization and model making that the computer has wrought Shaping Space is an exuberant richly illustrated interdisciplinary guide to three dimensional forms focusing on the surprisingly diverse world of polyhedra Geometry comes alive in Shaping Space as a remarkable range of geometric ideas is explored and its centrality in our culture is persuasively demonstrated The book is addressed to designers artists architects engineers chemists computer scientists mathematicians bioscientists crystallographers earth scientists and teachers at all levels in short to all scholars and educators interested in and working with two and three dimensional structures and patterns

Geometry beyond limits , 2010      **The Geometry of Natural Structure** Robert Williams, 2009-01-01 First published by the McDonnell Douglas Advanced Research Laboratories in 1969 with the title Handbook of Structure Research Communication 75 it became the most requested publication in the history of DARL A significantly expanded version was published by Eudaemon Press in 1972 with the title Natural Structure Toward a Form Language The third edition appeared as a Dover Science Book Publication titled The Geometrical Foundation of Natural Structure beginning in 1979 In the forty years that The Geometry of Natural Structure has been available to the public the work has continued to be a valuable resource tool for scientists architects and artists The Geometry of Natural Structure is a comprehensive work on geometric form in space A convenient and stimulating handbook for scientists and designers it covers the regular and semi regular polyhedra their various symmetries how they fit together to fill space and

other structural considerations Beginning with an introduction that places geometric structure in its proper mathematical context the author then presents a detailed description of the core geometric forms of natural structure polygons polyhedra aggregations of spheres and packings of polyhedra Topics considered include the inter relationships among geometrical topological forms the unit cell concept Golden Section surface area and volume relationships of polyhedra sphere coverings Euler s law and polyhedra distortions Mr Williams concludes with a rewarding discussion of the methodologies by which forms can be generated truncation rotation translation augmentation deletion fistulation and others The many tables located through out the text are extremely valuable for reference
