Genetics Of Cancer Genes Associated With Cancer Invasion Metastasis And Cell Proliferation:

The Genetics of Cancer Gajanan V. Sherbet, M. S. Lakshmi, 1997-06-22 Written by internationally recognized experts The Genetics of Cancer provides up to date information and insight into the genetic basis of cancer and the mechanisms involved in cancer invasion and its secondary spread This volume presents the deregulation of the cell cycle in tumor development and integrates the function of tumor suppressor genes oncogenes and metastasis associated genes in the pathogenesis and progression of cancer The Genetics of Cancer will be useful to all graduate students clinicians and researchers working in the fields of cancer biology genetics and molecular biology Clonal evolution of the metastasis phenotype Cell Cycle regulation Apoptosis in tumour growth and metastasis Angiogenesis in cancer Cell surface glycoproteins and their receptors Proteinases and their inhibitors in cancer invasion Oncogenes and cancer metastasis Developmental genes Tumour suppressor genes Metastasis suppressor genes Dominant metastasis associated genes

Genes and Environment in Cancer Manfred Schwab, Hartmut M. Rabes, Klaus Munk, Peter H. Hofschneider, 2012-12-06 Different cancer types can result from a multiplicity of genetic and environmental factors In recent years a number of genes have been identified as strong determinants for particular forms of cancer particularly colon and breast cancer The incomplete penetrance often evinced by the mutations of these genes has raised the possibility that additional endogenous or exogenous determinants contribute to cancer development or suppression The major aim of this book is to present an integrated view of the various environmental epidemiological and genetic determinants that contribute to a disease syndrome collectively known as cancer

Therapeutic Strategies in Cancer Biology and Pathology Gajanan V. Sherbet, 2013-07-26 Currently intensive effort is being directed toward the identification of molecular targets that can provide approaches to the development of novel therapeutic strategies in cancer management This book focuses on metastasis associated genes metastasis promoter and suppressor genes which relate specifically to behavioral alterations of cancer cells in epithelial mesenchymal transition cancer stem cell maintenance and propagation and to the acquisition of invasive and metastasis faculty The function of these genes has implications for cell cycle regulation and cell proliferation and so constitute an essential element in cancer growth and dissemination The emphasis in this book is on how appropriate these genes are as molecular targets and how practicable are the constituents of their signal transduction systems as potential candidates and how accessible they are to targeted therapy Written in a straightforward and clear style with background information supporting the new research this book will be useful for students and researchers in cancer therapies Identifies molecular targets and their accessibility for therapeutic intervention Provides information on biological features of tumor development and dissemination Background information provided for each topic

Molecular Mechanisms of Cancer Georg F. Weber, 2007-09-12 This book describes molecular processes whose deregulation is important in the formation of tumors The material is developed from basic cell signaling pathways to their roles in the clinical

manifestation of specific cancers Topics covered include molecular events intrinsic to tumor cells leading to growth deregulation extended lifespan and the ability to invade surrounding tissue protective mechanisms that prevent transformation including DNA repair and epigenetic regulation tumor host interactions with the endocrine system the immune system and blood vessel formation and the underlying molecular defects of individual cancers Calcium Signalling in Cancer G. V. Sherbet,2000-11-29 Calcium signalling occupies a preeminent position in the signal transduction system of the cell by virtue of its participation in a wide range of physiological functions together with the biological events associated with genetic expression cell proliferation and apoptosis as well as cell differentiation and morphogenesis It is an important feat

Principles and Practice of Surgical Oncology Howard Silberman,Allan W. Silberman,2012-03-28 Principles and Practice of Surgical Oncology uniquely

emphasizes a multidisciplinary integrated approach to the treatment of solid tumors. It presents treatment strategies that combine surgery with preoperative or postoperative adjunctive chemotherapy, hormonal therapy, and/or radiation therapy to achieve optimal outcome. The book features contributions from surgeons, basic scientists, pathologists, radiologists, radiation therapists, and medical oncologists and offers a comprehensive presentation of genetics, molecular biology, pathogenesis, and multimodal therapeutic approaches. A unique feature of the book is a commentary following each chapter which describes alternative approaches and discusses controversial areas of current therapy. Retinoids: Their Physiological Function and Therapeutic Potential G.V.

Sherbet, 1997-10-30 Retinoids have received considerable attention in recent years and due cognizance has been given to their versatility as biological response modifiers as evidenced by the virtually explosive growth of literature in this field in the past few years. This volume has been designed to give a current state of the art picture of retinoids. The perceived potential of retinoids in the treatment of certain disease states has initiated attempts at identifying and synthesizing new retinoid derivatives with definable and selective effects on aberrant biological phenomena. Appropriately therefore we begin with the chemistry of retinoids and their derivatives together with discussions of their biological activity. Major advances have been made in understanding the mechanisms by which retinoids modulate physiological and phenotypic traits of cells. The transduction of retinoid signaling by the mediation of nuclear receptors of the steroid/thyroid receptor superfamily has now been studied extensively and the cloning and defining the characteristics of these receptors has been a focus of discussion in this volume. Retinoids also markedly modulate the transduction of extracellular signals such as those imparted by growth factors and hormones and thus actively influence and control cellular proliferative patterns. Retinoids can alter epidermal growth factor receptor expression. Kawaguchi et al 1994 responsiveness to thyroid hormone. Esfandiari et al 1994. Pallet et al 1994 inhibit the proliferative responses of hematopoietic progenitor cells to granulocyte colony stimulating factor. Smeland et al 1994 and modulate secretion of interleukins by leukaemic cells. Balitrand et al 1994 among other things. This has obvious implications for pharmacological manipulation of deregulated growth. Dickens and Colletta 1993. Mulshine et al 1993. Apoptosis is another component in the regulation of growth control. Apoptotic cell death is influenced by several agents and retinoids may function by interfering with apoptotic pathways of regulation of growth control and quite legitimately therefore the importance of this aspect of retinoid function has been duly recognized here.
