Brandler, 2021-11-29 **Insect Evolutionary Ecology** Royal Entomological Society of London. Symposium, 2005 Insects provide excellent model systems for understanding evolutionary ecology They are abundant small and relatively easy to rear and these traits facilitate both field and laboratory experiments This book has been developed from the Royal Entomological Society's 22nd international symposium held in Reading in 2003 Topics include speciation and adaptation life history phenotype plasticity and genetics sexual selection and reproductive biology insect plant interactions insect natural enemy interactions and social insects **Genes in Ecology** R. J. Berry, T. J. Crawford, G. M. Hewitt, 1992-08 Geneticists and

ecologists confront the implications of the other's discipline for their own work population genetics and ecology Samuel Karlin, 2012-12-02 *Population Genetics and Ecology* is a collection of papers presented at a 1975 conference/workshop held in Israel and is devoted to topics in population genetics and ecology Contributors discuss topics related to population genetics and ecology including the determinants of genetic variation in natural populations experimental design and analysis of field and laboratory data and theory and applications of mathematical models in population genetics The book describes a number of field and laboratory studies that focus on a variety of spatial and temporal character and enzyme frequency patterns in natural populations along with possible associations between these patterns and ecological parameters This volume is

organized into three sections encompassing 31 chapters and begins by summarizing the results of field and laboratory research that investigated gene frequency patterns in space and time of animal and plant populations. This book then explains the origin of new taxa, animal and plant domestication, variation in heritability related to parental age and problems in the genetics of certain haplo-diploid populations. The next section offers a combination of data analyses and interpretations of related models, with some papers devoted to the origin of race formation and the interaction between sexual selection and natural selection. Among the theoretical studies presented are facets of selection-migration interaction, stochastic selection effects, properties of density and frequency-dependent selection, concepts and measures of genetic distance and speciation, aspects of altruism and kin selection. This book will be of interest to naturalists, experimentalists, theoreticians, statisticians and mathematicians. **Advances in Molecular Ecology** Gary R. Carvalho, 1998. Each contributor to this publication was asked to examine how molecular genetic tools have contributed to their specific areas of consideration. To increase the practical utility of the book, a summary of software that is available for the analysis of data in molecular ecology is included.

**Integrating Ecology and Evolution in a Spatial Context** Jonathan Silvertown, Janis Antonovics, 2001-08. The profound consequences of the deceptively obvious statement that plants stand still but their genes don't are only just becoming clear. In this volume, an international team of authors, experts in the field of population biology, aim to advance our understanding of ecological and evolutionary processes by integrating them within a common frame of reference: space. Processes operating at three different spatial scales are examined: that of the population, metapopulation and the geographical range. Themes that recur at these different scales include spatial population dynamics, population genetics at boundaries, the imprint of spatial population dynamics upon genetic structure, adaptation, evolution of mating systems and the consequences of population genetics for ecological dynamics. Whilst the focus is largely on plants, the questions addressed are equally applicable to animals. It will be a valuable tool for researchers and advanced students not only in this field but also evolutionary biology and resource management. **Ecological Speciation** Patrik Nosil, 2012-03-15. It then reviews the three components of ecological speciation and discusses the geography and genomic basis of the process. **Forest Conservation Genetics** Andrew Graham Young, 2000. Basic genetic principles, Genetic processes, Threats to in situ genetic conservation, Domestication and ex situ genetic conservation, Monitoring socioeconomics and policy. **Life Underground** Eileen A. Lacey, 2000-09. Many mammals like to dig in the dirt but few call it home. Those that do, such as mole rats, zokors and tuco-tucos, have developed novel adaptations to their subterranean life, including bones and muscles modified for efficient digging and ways to see underground without using their eyes. These unusual traits, adopted independently by unrelated groups around the world, also make subterranean rodents fascinating subjects for biologists. Life Underground provides the first comprehensive review of the biology of subterranean rodents. Arranged by topic rather than by taxon to facilitate cross-species comparisons, chapters cover such subjects as morphology, physiology, social behavior, genetic variation and

evolutionary diversification Two main questions run throughout the book First to what extent has subterranean life shaped the biology of these animals leading to similar adaptations among otherwise dissimilar species Second how have the distinct evolutionary histories of these groups led to different solutions to the challenges posed by life underground

*Molecular Ecology And Evolution: The Organismal Side: Selected Writings From The Avise Laboratory* John C Avise, 2010-08-18 This volume is a reprinted collection of 69 classics from the Avise laboratory chosen to illustrate a trademark brand of research that harnesses molecular markers to scientific studies of natural history and evolution in the wild Spanning the early 1970s through the late 2000s these articles trace how the author and his colleagues have used molecular genetics techniques to address multifarious conceptual topics in genetics ecology and evolution in a fascinating menagerie of creatures with oft peculiar lifestyles The organisms described in this volume range from blind cavefish to male pregnant pipefishes and sea spiders from clonal armadillos to natal homing marine turtles from hermaphroditic sea snails to hybridizing monkeys and tree frogs from clonal marine sponges to pseudohermaphroditic mollusks to introgressing oysters and from endangered pocket gophers terrapins and sparrows to unisexual all female fish species to living fossil horseshoe crabs and even to a strange little fish that routinely mates with itself The conceptual and molecular topics addressed in this volume are also universal ranging from punctuated equilibrium to coalescent theory to the need for greater standardization in taxonomy from cytonuclear disequilibrium statistics to the ideas of speciation duration and sympatric speciation from historical population demography to phylogenetic reconstructions of males sexual ornaments from the population genetic consequences of inbreeding to Pleistocene effects on phylogeography and from the molecular underpinnings of null alleles to the notion of clustered mutations that arise in groups to compelling empirical evidence for the unanticipated processes of gene conversion and concerted evolution in animal mitochondrial DNA Overall this collection includes many of the best most influential sometimes controversial occasionally provocative always intriguing or otherwise entertaining publications to have emerged from the Avise laboratory over the last four decades Thus this book conveys through the eyes of one of the field's longstanding pioneers what the organismal side of molecular ecology and evolution really means

*Evolution of the House Mouse* Miloš Macholán, Stuart J. E. Baird, Pavel Munclinger, Jaroslav Piálek, 2012-07-19 The house mouse is the source of almost all genetic variation in laboratory mice its genome was sequenced alongside that of humans and it has become the model for mammalian speciation Featuring contributions from leaders in the field this volume provides the evolutionary context necessary to interpret these patterns and processes in the age of genomics The topics reviewed include mouse phylogeny phylogeography origins of commensalism adaptation and dynamics of secondary contacts between subspecies Explorations of mouse behaviour cover the nature of chemical and ultrasonic signalling recognition and social environment The importance of the mouse as an evolutionary model is highlighted in reviews of the first described example of meiotic drive t haplotype and the first identified mammalian speciation gene Prdm9 This detailed overview of house mouse evolution

is a valuable resource for researchers of mouse biology as well as those interested in mouse genetics evolutionary biology behaviour parasitology and archaeozoology

**Evolutionary Ecology of Freshwater Animals** Bruno Streit,Thomas Stadler,Curtis M. Lively,1997 Evolutionary ecology includes aspects of community structure trophic interactions life history tactics and reproductive modes analyzed from an evolutionary perspective Freshwater environments often impose spatial structure on populations e g within large lakes or among habitat patches facilitating genetic and phenotypic divergence Traditionally freshwater systems have featured prominently in ecological research and population biology This book brings together information on diverse freshwater taxa with a mix of critical review synthesis and case studies Using examples from bryozoans rotifers cladocerans molluscs teleosts and others the authors cover current conceptual issues of evolutionary ecology in considerable depth The book can serve as a source of critically evaluated ideas detailed case studies and open problems in the field of evolutionary ecology It is recommended for students and researchers in ecology limnology population biology and evolutionary biology

**Proceedings RMRS.** ,1998 *The International Encyclopedia of Primatology, 3 Volume Set* Agustín Fuentes,2017-04-24 The International Encyclopedia of Primatology represents the first comprehensive encyclopedic reference focusing on the behaviour biology ecology evolution genetics and taxonomy of human and non human primates Represents the first comprehensive encyclopedic reference relating to primatology Features more than 450 entries covering topics ranging from the taxonomy history behaviour ecology captive management and diseases of primates to their use in research cognition conservation and representations in literature Includes coverage of the basic scientific concepts that underlie each topic along with the latest advances in the field Highly accessible to undergraduate and graduate students in primatology anthropology and the medical biological and zoological sciences Essential reference for academics researchers and commercial and conservation organizations This work is also available as an online resource at [www.encyclopediaofprimatology.com](http://www.encyclopediaofprimatology.com)

**Golden-winged Warbler Ecology, Conservation, and Habitat Management** Henry M. Streby,David E. Andersen,David Buehler,2016-10-26 Golden winged Warblers *Vermivora chrysoptera* are migratory songbirds that breed in temperate North America primarily in the Great Lakes region with remnant populations throughout the Appalachian Mountains and winter in Central and northern South America Their breeding range has contracted dramatically in the Appalachian Mountains and many populations have dramatically declined likely due to habitat loss competition and interbreeding with Blue winged Warblers *Vermivora pinus* and global climate change As a result of population declines in much of the eastern portion of their breeding range Golden winged Warblers are listed as endangered or threatened in 10 U S states and in Canada and have been petitioned for protection under the U S Endangered Species Act Published in collaboration with and on behalf of The American Ornithological Society this volume in the highly regarded Studies in Avian Biology series compiles extensive current research on Golden winged Warblers and summarizes what is known and identifies many remaining unknowns providing a wealth of peer reviewed science on which future research and

listing decisions can be based      *Evolution through Genetic Exchange* Michael L Arnold, 2006-07-27 Even before the publication of Darwin's *Origin of Species* the perception of evolutionary change has been a tree like pattern of diversification with divergent branches spreading further and further from the trunk In the only illustration of Darwin's treatise branches large and small never reconnect However it is now evident that this view does not adequately encompass the richness of evolutionary pattern and process Instead the evolution of species from microbes to mammals builds like a web that crosses and re crosses through genetic exchange even as it grows outward from a point of origin Some of the avenues for genetic exchange for example introgression through sexual recombination versus lateral gene transfer mediated by transposable elements are based on definably different molecular mechanisms However even such widely different genetic processes may result in similar effects on adaptations either new or transferred genome evolution population genetics and the evolutionary ecological trajectory of organisms For example the evolution of novel adaptations resulting from lateral gene transfer leading to the flea borne deadly causative agent of plague from a rarely fatal orally transmitted bacterial species is quite similar to the adaptations accrued from natural hybridization between annual sunflower species resulting in the formation of several new species Thus more and more data indicate that evolution has resulted in lineages consisting of mosaics of genes derived from different ancestors It is therefore becoming increasingly clear that the tree is an inadequate metaphor of evolutionary change In this book Arnold promotes the web of life metaphor as a more appropriate representation of evolutionary change in all lifeforms This research level text is suitable for senior undergraduate and graduate level students taking related courses in departments of genetics ecology and evolution It will also be of relevance and use to professional evolutionary biologists and systematists seeking a comprehensive and authoritative overview of this rapidly expanding field      *Visitor Use Density and Wilderness Experience* Wayne A. Freimund, 2001      **Divergence with Genetic Exchange** Michael Lynn Arnold, 2016 This book is an investigation into processes associated with evolutionary divergence and diversification focussing on the role played by the exchange of genes between divergent lineages
