Geomathematics: Theoretical Foundations, Applications and Future Developments Frits Agterberg, 2014-07-14 This book provides a wealth of geomathematical case history studies performed by the author during his career at the Ministry of Natural Resources Canada Geological Survey of Canada NRCan GSC Several of the techniques newly developed by the author and colleagues that are described in this book have become widely adopted not only for further research by geomathematical colleagues but by government organizations and industry worldwide These include Weights of Evidence modelling mineral resource estimation technology trend surface analysis automatic stratigraphic correlation and nonlinear geochemical exploration methods The author has developed maximum likelihood methodology and spline fitting techniques for the construction of the international numerical geologic timescale He has introduced the application of new theory of fractals and multi fractals in the geostatistical evaluation of regional mineral resources and ore reserves and to study the spatial distribution of metals in rocks The book also contains sections deemed important by the author but that have not been widely adopted because they require further research These include the geometry of preferred orientations of contours and edge effects on maps time series analysis of Quaternary retreating ice sheet related sedimentary data estimation of first and last appearances of fossil taxa from frequency distributions of their observed first and last occurrences tectonic reactivation along pre existing schistosity planes in fold belts use of the grouped jackknife method for bias reduction in geometrical extrapolations and new applications of the theory of permanent volume independent frequency distributions

provides concise explanation on each term that is related to Mathematical Geosciences Over 300 international scientists each expert in their specialties have written around 350 separate articles on different topics of mathematical geosciences including contributions on Artificial Intelligence Big Data Compositional Data Analysis Geomathematics Geostatistics Geographical Information Science Mathematical Morphology Mathematical Petrology Multifractals Multiple Point Statistics Spatial Data Science Spatial Statistics and Stochastic Process Modeling Each topic incorporates cross referencing to related articles and also has its own reference list to lead the reader to essential articles within the published literature The entries are arranged alphabetically for easy access and the subject and author indices are comprehensive and extensive

Handbook of Mathematical Geosciences B.S. Daya Sagar, Qiuming Cheng, Frits Agterberg, 2018-06-25 This Open Access handbook published at the IAMG's 50th anniversary presents a compilation of invited path breaking research contributions by award winning geoscientists who have been instrumental in shaping the IAMG It contains 45 chapters that are categorized broadly into five parts i theory ii general applications iii exploration and resource estimation iv reviews and v reminiscences covering related topics like mathematical geosciences mathematical morphology geostatistics fractals and multifractals spatial statistics multipoint geostatistics compositional data analysis informatics geocomputation numerical methods and chaos theory in the geosciences *Geocom Bulletin*, 1974 Issues for Jan 1968 include section called Geocom supplement GS1

Image Processing and GIS for Remote Sensing Jian Guo Liu, Philippa J. Mason, 2016-03-21 Following the successful publication of the 1st edition in 2009 the 2nd edition maintains its aim to provide an application driven package of essential techniques in image processing and GIS together with case studies for demonstration and guidance in remote sensing applications The book therefore has a 3 in 1 structure which pinpoints the intersection between these three individual disciplines and successfully draws them together in a balanced and comprehensive manner The book conveys in depth knowledge of image processing and GIS techniques in an accessible and comprehensive manner with clear explanations and conceptual illustrations used throughout to enhance student learning The understanding of key concepts is always emphasised with minimal assumption of prior mathematical experience The book is heavily based on the authors own research Many of the author designed image processing techniques are popular around the world For instance the SFIM technique has long been adopted by ASTIRUM for mass production of their standard Pan sharpen imagery data The new edition also includes a completely new chapter on subpixel technology and new case studies based on their recent research

Monitoring Continuous Phenomena Peter Lorkowski, 2021-06-24 Monitoring continuous phenomena by stationary and mobile sensors has become a common due to the improvement in hardware and communication infrastructure and decrease in its cost Sensor data is now available in near real time via web interfaces and in machine readable form facilitated by paradigms like the Internet of Things IoT There are still some obstacles in the usability of the data since the positions in space and time of observation and the positions of interest usually do not coincide Interpolation is the technique to fill such

gaps and there are manifold methods to perform it To actually operate a monitoring system there are problems like unambiguous identification of interpolation method and associated parameters appropriate interface to store observations and retrieve interpolated data continuous update of the interpolation model for real time monitoring compression and progressive retrieval of observational data and critical states definition and notification by using aggregation of values This book proposes a general system architecture that addresses these problems It is not confined to details about particular interpolation methods but rather takes a holistic view on the problem of monitoring State of the art technologies like geostatistics sensor web enablement and field data types are introduced and applied in order to provide a viable toolset for the problem domain The focus is on the overall organization of the monitoring and the architectural design of the software system and the associated simulation framework that is used to systematically evaluate different monitoring approaches The whole cycle of a monitoring entailing observation interpolation discretization storage retrieval and notification is covered Concrete solutions for several common problems in this context are provided *Geologie en Mijnbouw*, 1979 Progress in Geomathematics Graeme Bonham-Carter, Cheng Qiuming, 2008-09-20 Celebrating Frits Agterberg's half century of publication activity in geomathematics this volume's 28 timely papers written by his friends and colleagues treat a variety of subjects of current interest many of them also studied by Frits including spatial analysis in mineral resource assessment quantitative stratigraphy nonlinear multifractal models compositional data analysis time series analysis image analysis and geostatistics Professor Agterberg published his first paper as a graduate student in 1958 and has since produced and continues to publish a steady stream of research papers on a wide variety of subjects of interest to geomathematical practitioners Most of the papers included here address methodology and feature practical case studies so that the book likely has broad appeal to those interested in mathematical geosciences both to academic researchers seeking a comprehensive overview and also to practitioners of geomathematical approaches in industry **Handbook of Geomathematics** Willi Freeden, M. Zuhair Nashed, Thomas Sonar, 2010-08-13 During the last three decades geosciences and geo engineering were influenced by two essential scenarios First the technological progress has changed completely the observational and measurement techniques Modern high speed computers and satellite based techniques are entering more and more all geodisciplines Second there is a growing public concern about the future of our planet its climate its environment and about an expected shortage of natural resources Obviously both aspects viz efficient strategies of protection against threats of a changing Earth and the exceptional situation of getting terrestrial airborne as well as spaceborne data of better and better quality explain the strong need of new mathematical structures tools and methods Mathematics concerned with geoscientific problems i.e. Geomathematics is becoming increasingly important The Handbook Geomathematics as a central reference work in this area comprises the following scientific fields I observational and measurement key technologies II modelling of the system Earth geosphere cryosphere hydrosphere atmosphere biosphere III analytic algebraic and operator theoretic

Space and Time in Geomorphology Colin E. Thorn, 2020-05-10 This book first published in 1982 is a collection of articles aimed at advancing the field of geomorphology It starts from the position that a meaningful grasp of landscape evolution would depend upon an understanding of the present spatial distribution of processes and process rates comparison of spatial versus temporal change and careful appraisal of the character and composition of the stratigraphic record Each article uses a data set to address between threshold variability in either a spatial or temporal context and often both

An Invitation to Geomathematics Willi Freeden, Clemens Heine, M. Zuhair Nashed, 2019-05-17 The authors introduce geomathematics as an active research area to a wider audience Chapter 1 presents an introduction to the Earth as a system to apply scientific methods Emphasis is laid on transfers from virtual models to reality and vice versa In the second chapter geomathematics is introduced as a new scientific area which nevertheless has its roots in antiquity The modern conception of geomathematics is outlined from different points of view and its challenging nature is described as well as its interdisciplinarity Geomathematics is shown as the bridge between the real world and the virtual world The complex mathematical tools are shown from a variety of fields necessary to tackle geoscientific problems in the mathematical language Chapter 3 contains some exemplary applications as novel exploration methods Particular importance is laid on the change of language when it comes to translate measurements to mathematical models New solution methods like the multiscale mollifier technique are presented Further applications discussed are aspects of reflection seismics Chapter 4 is devoted to the short description of recent activities in geomathematics The Appendix Chapter 5 is devoted to the GEM International Journal on Geomathematics founded ten years ago Besides a detailed structural analysis of the editorial goals an index of all papers published in former issues is given
