Geometries, Codes and Cryptography G. Longo, M. Marchi, A. Sgarro, 2014-05-04 The general problem studied by information theory is the reliable transmission of information through unreliable channels Channels can be unreliable either because they are disturbed by noise or because unauthorized receivers intercept the information transmitted In the first case the theory of error control codes provides techniques for correcting at least part of the errors caused by noise In the second case cryptography offers the most suitable methods for coping with the many problems linked with secrecy and authentication Now both error control and cryptography schemes can be studied to a large extent by suitable geometric models belonging to the important field of finite geometries This book provides an update survey of the state of the art of finite geometries and their applications to channel coding against noise and deliberate tampering The book is divided into two sections Geometries and Codes and Geometries and Cryptography The first part covers such topics as Galois geometries Steiner systems Circle geometry and applications to algebraic coding theory The second part deals with unconditional secrecy and authentication geometric threshold schemes and applications of finite geometry to cryptography This volume recommends itself to engineers dealing with communication problems to mathematicians and to research workers in the fields of algebraic coding theory cryptography and information theory

Lattices and Codes Wolfgang Ebeling, 2012-12-06 The purpose of coding theory is the design of efficient systems for the transmission of information. The mathematical treatment leads to certain finite structures: the error-correcting codes. Surprisingly, problems which are interesting for the design of codes turn out to be closely related to problems studied partly

earlier and independently in pure mathematics This book is about an example of such a connection the relation between codes and lattices Lattices are studied in number theory and in the geometry of numbers Many problems about codes have their counterpart in problems about lattices and sphere packings We give a detailed introduction to these relations including recent results of G van der Geer and F Hirzebruch Let us explain the history of this book In LPS82 J S Leon V Pless and N J A Sloane considered the Lee weight enumerators of self dual codes over the prime field of characteristic 5 They wrote in the introduction to their paper The weight enumerator of any one of the codes is strongly constrained it must be invariant under a three dimensional representation of the icosahedral group These invariants were already known to Felix Klein and the consequences for coding theory were discovered by Gleason and Pierce and independently by the third author It is worth mentioning that precisely the same invariants have recently been studied by Hirzebruch in connection with cusps of the Hilbert modular surface associated with $\mathbb{Q}(\sqrt{5})$
