## Geometry Of Spheres In Normed Spaces:

Geometry of Spheres in Normed Spaces Juan Jorge Schäffer,1976      **Geometry of Linear 2-normed Spaces** Raymond W. Freese,Yeol Je Cho,2001      **Geometric Nonlinear Functional Analysis** Yoav Benyamini,Joram Lindenstrauss,2000 A

systematic study of geometric nonlinear functional analysis The main theme is the study of uniformly continuous and Lipschitz functions between Banach spaces This study leads to the classification of Banach spaces and of their important subsets in the uniform and Lipschitz categories      *Handbook of Metric Fixed Point Theory* W.A. Kirk,B. Sims,2013-04-17 Metric fixed point theory encompasses the branch of fixed point theory which metric conditions on the underlying space and or on the mappings play a fundamental role In some sense the theory is a far reaching outgrowth of Banach's contraction mapping principle A natural extension of the study of contractions is the limiting case when the Lipschitz constant is allowed to equal one Such mappings are called nonexpansive Nonexpansive mappings arise in a variety of natural ways for example in the study of holomorphic mappings and hyperconvex metric spaces Because most of the spaces studied in analysis share many algebraic and topological properties as well as metric properties there is no clear line separating metric fixed point theory from the topological or set theoretic branch of the theory Also because of its metric underpinnings metric fixed point theory has provided the motivation for the study of many geometric properties of Banach spaces The contents of this Handbook reflect all of these facts The purpose of the Handbook is to provide a primary resource for anyone interested in fixed point theory with a metric flavor The goal is to provide information for those wishing to find results that might apply to their own work and for those wishing to obtain a deeper understanding of the theory The book should be of interest to a wide range of researchers in mathematical analysis as well as to those whose primary interest is the study of fixed point theory and the underlying spaces The level of exposition is directed to a wide audience including students and established researchers      **Geometric Aspects of Convex Sets with the Radon-Nikodym Property** R. **Handbook of Differential Geometry** Franki J.E. Dillen,Leopold C.A. Verstraelen,2005-11-29 In the series of volumes which together will constitute the Handbook of Differential Geometry we try to give a rather complete survey of the field of differential geometry The different chapters will both deal with the basic material of differential geometry and with research results old and recent All chapters are written by experts in the area and contain a large bibliography In this second volume a wide range of areas in the very broad field of differential geometry is discussed as there are Riemannian geometry Lorentzian geometry Finsler geometry symplectic geometry contact geometry complex geometry Lagrange geometry and the geometry of foliations Although this does not cover the whole of differential geometry the reader will be provided with an overview of some its most important areas Written by experts and covering recent research Extensive bibliography Dealing with a diverse range of areas Starting from the basics      *Geometry of Banach Spaces, Duality Mappings and Nonlinear Problems* I. Thompson, 1996-06-28 Minkowski geometry is a non Euclidean geometry in a finite number of dimensions that is different from elliptic and hyperbolic geometry and from the Minkowskian geometry of spacetime Here the linear structure is the same as the Euclidean one but distance is not uniform in all directions Instead of the usual sphere in Euclidean space the unit ball is a general symmetric convex set Therefore although the parallel axiom is valid Pythagoras theorem is not This book begins by presenting the topological properties of Minkowski spaces including the existence and essential uniqueness of Haar measure followed by the fundamental metric properties the group of isometries the existence of certain bases and the existence of the Lowner ellipsoid This is followed by characterizations of Euclidean space among normed spaces and a full treatment of two dimensional spaces The three central chapters present the theory of area and volume in normed spaces The author describes the fascinating geometric interplay among the isoperimetrix the convex body which solves the isoperimetric problem the unit ball and their duals and the ways in which various roles of the ball in Euclidean space are divided among them The next chapter deals with trigonometry in Minkowski spaces and the last one takes a brief look at a number of numerical parameters associated with a normed space including J J Schaffer s ideas on the intrinsic geometry of the unit sphere Each chapter ends with a section of historical notes and the book ends with a list of 50 unsolved problems Minkowski Geometry will appeal to students and researchers interested in geometry convexity theory and functional analysis

The Steiner Ratio Dietmar Cieslik, 2013-03-14 Steiner's Problem concerns finding a shortest interconnecting network for a finite set of points in a metric space A solution must be a tree which is called a Steiner Minimal Tree SMT and may contain vertices different from the points which are to be connected Steiner's Problem is one of the most famous combinatorial geometrical problems but unfortunately it is very difficult in terms of combinatorial structure as well as computational complexity However if only a Minimum Spanning Tree MST without additional vertices in the interconnecting network is sought then it is simple to solve So it is of interest to know what the error is if an MST is constructed instead of an SMT The worst case for

this ratio running over all finite sets is called the Steiner ratio of the space The book concentrates on investigating the Steiner ratio The goal is to determine or at least estimate the Steiner ratio for many different metric spaces The author shows that the description of the Steiner ratio contains many questions from geometry optimization and graph theory Audience Researchers in network design applied optimization and design of algorithms **partial differential equation methods in control and shape analysis** Giuseppe Da Prato, Jean-Paul Zolesio, 1997-02-20 Based on the International Federation for Information Processing WG 7.2 Conference held recently in Pisa Italy Provides recent results as well as entirely new material on control theory and shape analysis Written by leading authorities from various disciplines
