Hardware Verification Language:

The e Hardware Verification Language Sasan Iman, Sunita Joshi, 2007-05-08 I am glad to see this new book on the e language and on verification I am especially glad to see a description of the e Reuse Methodology eRM The main goal of verification is after all finding more bugs quicker using given resources and verification reuse module to system old system to new system etc is a key enabling component This book offers a fresh approach in teaching the e hardware verification language within the context of coverage driven verification methodology I hope it will help the reader understand the many important and interesting topics surrounding hardware verification Yoav Hollander Founder and CTO Verisity Inc Preface This book provides a detailed coverage of the e hardware verification language HVL state of the art verification methodologies and the use of e HVL as a facilitating verification tool in implementing a state of the art verification environment It includes comprehensive descriptions of the new concepts introduced by the e language e language syntax and its associated semantics This book also describes the architectural views and requirements of verification environments randomly generated environments coverage driven verification environments etc verification blocks in the architectural views i e generators initiators controllers checkers monitors coverage definitions etc and their implementations using the e HVL Moreover the e Reuse Methodology eRM the motivation for defining such a guideline and step by step instructions for building an eRM compliant e Verification Component eVC are also discussed *Hardware Verification with System Verilog* Mike Mintz, Robert Ekendahl, 2007-05-03 This is the second of our books designed to help the professional verifier manage complexity This time we have responded to a growing interest not only in object oriented programming but also in SystemVerilog The writing of this second handbook has been just another step in an ongoing masochistic endeavor to make your professional lives as painfree as possible The authors are not special people We have worked in several companies large and small made mistakes and generally muddled through our work There are many people in the industry who are smarter than we are and many coworkers who are more experienced However we have a strong desire to help We have been in the lab when we bring up the chips fresh from the fab with customers and sales breathing down our necks We've been through software 1 bring up and worked on drivers that had to work around bugs in production chips What we feel makes us unique is our combined broad experience from both the software and hardware worlds Mike has over 20 years of experience from the software world that he applies in this book to hardware verification Robert has over 12 years of experience with hardware verification with a focus on environments and methodology Verification Plans Peet James, 2011-06-28 Verification is job one in today's modern design process Statistics tell us that the verification process takes up a majority of the overall work Chips that come back dead on arrival scream that verification is at fault for not finding the mistakes How do we ensure success After an accomplishment have you ever had someone ask you Are you good or are you just lucky Many design projects depend on blind luck in hopes that the chip will work Others just adamantly rely on their own abilities to

bring the chip to success in either case how can we tell the difference between being good or lucky There must be a better way not to fail Failure No one likes to fail in his book *The Logic of Failure* Dietrich Dörner argues that failure does not just happen A series of wayward steps leads to disaster Often these wayward steps are not really logical decisive steps but more like default omissions Anti planning if you will an ad hoc approach to doing something To not plan then is to fail

Hardware Verification Todd Jeffry Wagner, 1977 Methods for detecting logical errors in computer hardware designs using symbolic manipulation instead of digital simulation are discussed A non procedural register transfer language is proposed that is suitable for describing how a digital circuit should perform This language can also be used to describe each of the components used in the design Transformations are presented which should enable the designer to either prove or disprove that the set of interconnected components correctly satisfy the specifications for the overall system The problem of detecting timing anomalies such as races hazards and oscillations is addressed Also explored are some interesting relationships between the problems of hardware verification and program verification Finally the results of using an existing proof checking program on some digital circuits are presented Although the theorem proving approach is not very efficient for simple circuits it becomes increasingly attractive as circuits become more complex This is because the theorem proving approach can use complicated component specifications without reducing them to the gate level Author **Hardware**

Automated Theorem Proving Graham Birtwistle, P.A. Subrahmanyam, 2012-12-06 This report describes the partially completed correctness proof of the Viper block model Viper 7 8 9 11 23 is a microprocessor designed by W J Cullyer C Pygott and J Kershaw at the Royal Signals and Radar Establishment in Malvern England henceforth RSRE for use in safety critical applications such as civil aviation and nuclear power plant control It is currently finding uses in areas such as the deployment of weapons from tactical aircraft To support safety critical applications Viper has a particularly simple design about which it is relatively easy to reason using current techniques and models The designers who deserve much credit for the promotion of formal methods intended from the start that Viper be formally verified Their idea was to model Viper in a sequence of decreasingly abstract levels each of which concentrated on some aspect of the design such as the flow of control the processing of instructions and so on That is each model would be a specification of the next less abstract model and an implementation of the previous model if any The verification effort would then be simplified by being structured according to the sequence of abstraction levels These models or levels of description were characterized by the design team The first two levels and part of the third were written by them in a logical language amenable to reasoning and proof

Generating Hardware Assertion Checkers Marc Boulé, Zeljko Zilic, 2008-06-01 Assertion based design is a powerful new paradigm that is facilitating quality improvement in electronic design Assertions are statements used to describe properties of the design I e design intent that can be included to actively check correctness throughout the design cycle and even the lifecycle of the product With the appearance of two new languages PSL and SVA assertions have already started to improve verification quality and productivity This is the first book that presents an under the hood view of generating assertion checkers and as such provides a unique and consistent perspective on employing assertions in major areas such as specification verification debugging on line monitoring and design quality improvement
