Purohit, 2006-01-01 The first part of this book addresses in detail the correlations between alcohol and carcinogenicity focusing on specific organs such as the upper aerodigestive tract liver colon pancreas and breast This includes the impairment of methionine folate metabolism and DNA methylation by alcohol as well as the use of S-adenosylmethionine to prevent cancer Furthermore the synergistic effects of reactive oxygen species and iron in producing liver cancer are addressed The second part is dedicated to the role of tobacco in lung and digestive tract cancers and to their prevention highlighting the role of phytochemicals More specifically the mutagenic mitogenic precarcinogenic anti apoptotic and immunosuppressive properties of nicotine which are involved in the development of cancer and the possible use of nicotine vaccine in the prevention of mortality associated with tobacco are discussed Chemical Carcinogenesis Francesco

Feo, 1988 About two centuries after the communication by Sir Percival Pott that the chimney sweeper disease was a cancer

and its suggestion that active compounds of soot were the causative agents and about one century after the description of urinary bladder cancer in dye workers an enormous number of substances have been synthesized and have probably come into contact with man Research in cancer prevention is of primary importance and may receive continuous support from new discoveries on cancer etiology and pathogenesis If one accepts the multistage model of chemical carcinogenesis one has also to accept that many events occur between the contact of carcinogenic compounds and their specific targets and the development of a clinically recognizable neoplasm Thus animal studies become essential to elucidate the different steps by which chemical carcinogens induce neoplasia The analysis of these steps and the comparative evaluation of experimental models is essential to an understanding of pathogenesis
