Ecosystem Concepts for Sustainable Bivalve Mariculture National Research Council,Division on Earth and Life Studies,Ocean Studies Board,Committee on Best Practices for Shellfish Mariculture and the Effects of Commercial Activities in Drakes Estero, Pt. Reyes National Seashore,

California, 2010-04-18 U S mariculture production of bivalve molluscs those cultivated in the marine environment has roughly doubled over the last 25 years Although mariculture operations may expand the production of seafood without additional exploitation of wild populations they still depend upon and affect natural ecosystems and ecosystem services Every additional animal has an incremental effect arising from food extraction and waste excretion Increasing domestic seafood production in the United States in an environmentally and socially responsible way will likely require the use of policy tools such as best management practices BMPs and performance standards BMPs represent one approach to protecting against undesirable consequences of mariculture An alternative approach to voluntary or mandatory BMPs is the establishment of performance standards for mariculture Variability in environmental conditions makes it difficult to develop BMPs that are sufficiently flexible and adaptable to protect ecosystem integrity across a broad range of locations and conditions An alternative that measures performance in sustaining key indicators of ecosystem state and function may be more effective Because BMPs address mariculture methods rather than monitoring actual ecosystem responses they do not guarantee that detrimental ecosystem impacts will be controlled or that unacceptable impact will be avoided Ecosystem Concepts for Sustainable Bivalve Mariculture finds that while performance standards can be applied for some broad ecosystem indicators BMPs may be more appropriate for addressing parameters that change from site to site such as the species being cultured different culture methods and various environmental conditions This book takes an in depth look at the environmental social and economic issues to present recommendations for sustainable bivalve mariculture

Pollution Impacts on Marine Biotic Communities

Michael J. Kennish, 2020-11-25 Pollution of estuaries and coastal marine waters is of profound ecological and societal importance These coastal environments serve as critical habitat for a multitude of organisms and are of great commercial and recreational value to humans Designed to meet the research monitoring and assessment needs of scientists administrators planners and managers Pollution Impacts on Marine Biotic Communities is a uniquely comprehensive reference covering pollution in coastal marine and estuarine waters The book provides a detailed look at the short and long term impacts of pollutants on these ecologically important regions Case studies that reflect a broad range of pollution problems are analyzed outlining the real life issues and providing solutions to common problems Despite being highly sensitive systems estuarine and coastal marine environments have served as repositories for dredge spoils sewage sludge and industrial and municipal effluents for many decades The adverse effects of these pollutants are only now being fully realized and understood Pollution Impacts on Marine Biotic Communities includes a basic introduction to the subject of pollution in estuarine and marine environments and also a detailed examination of specific marine pollutants Both the coverage and the format which includes abundant illustrations and tables make this book a valuable reference for scientists administrators and students engaged in coastal research and planning

The Biology of Sea Turtles, Volume I Peter L. Lutz, John A. Musick, 2017-12-06 Sea turtles have existed for millions of years making them fascinating subjects of study In

the last 20 years the science of sea turtle biology has expanded at an exponential rate leading to major advances in many areas This book synthesizes the results of these advances and focuses on how these endangered marine reptiles operate in adapt to and are dependent upon particular features of their marine environment New technology in data gathering such as DNA analyses remote sensing and physiological monitoring techniques has led to a much greater understanding of the biology of the sea turtle at all stages of their life history *Molluscan shellfish research and management* ,2004 **The**

Comparative Roles of Suspension-Feeders in Ecosystems Richard F. Dame,Sergej Olenin,2006-03-30 Animals are a major link between the water column pelagic and the bottom benthic habitats in most shallow systems This coupling is dominated by active processes such as suspension feeding in which the organism actively uses energy to pump water that is then filtered to remove suspended particles that are consumed while undigested remains are deposited on the bottom As a result of this feeding on and metabolism of particles the animals excrete dissolved inorganic and organic waste back into the water column and thus become major components in the cycling and feedback of essential elements With relatively high weight specific filtration rates of 1 10 liters hour gram dry tissue and a propensity to form large aggregated populations beds reefs schools and swarms these organisms can play an important role in regulating water column processes Although estuarine bivalve molluscs such as oysters and mussels dominate the suspension feeder literature other groups including plankton and nekton that are found in estuarine as well as other aquatic systems are also potentially important removers of suspended particles Thus a significant part of the NATO Advanced Research Workshop focused on suspension feeders as controllers of plankton abundance biomass and diversity system metabolism nutrient cycling and scale dependency Systems dominated by suspension feeders are typically impacted by human activities including recreation aquaculture human and industrial pollution and bilge water from shipping Suspension feeders are often impacted by fisheries and over exploitation These impacts commonly result in changes in ecosystem structure either through the food chain concentration of harmful substances or diseases the introduction of alien species of suspension feeders or the instability of suspension feeders systems through species displacement or phase shifts in the dominance between different suspension feeding components such as nekton or zooplankton These issues were addressed near the close of the workshop along with conclusions and syntheses developed by the working groups

Restoration of Aquatic Systems Robert J.
